16. Abstract The thermodynamic properties of propane, propylene, n-butane and ethylene were calculated and are presented in tables. The tables list the values of the specific volume, the enthalpy, the entropy, the specific heat at constant pressure, the specific heat at constant volume and the sonic velocity of the four hydrocarbons in a temperature and pressure range which can be encountered when these commodities are shipped by rail tank cars. This includes subcooled states, saturation equilibrium states and superheated states. The computer program with which the tables were generated is discussed in detail and a complete listing of the program is given. The underlying thermodynamic theory and the equation of state used in the development of the presented data was given in Report No. FRA-ORD 76/299 and is not repeated. The present report is user-oriented in that it gives extensive tables and a complete listing of the computer program with which these tables were generated.			
17. Key Words Propane, Propylene, N-Butane, Ethylene, Thermodynamic Data, Liquified Petroleum Gases.		18. Distribution Statement This document is available to the public through the Technical Information Service, Springfield, Virginia 22161.

PREFACE

The authors would like to express their gratitude to the Computer Science Center of the University of Maryland for matching sponsored computer time on a one-to-one basis and for generously granting additional computer time when the computer time paid for by this contract and the matched time were exceeded. This program is under the technical direction of Mr. David M. Dancer of the Federal Railroad Administration. His cooperation and his administrative as well as technical contributions are gratefully acknowledged.

This report is the follow-up report to FRA-ORD 76/299 entitled "Thermodynamic Properties of Liquified Petroleum Gases (LPG)". While report FRA-ORD 76/299 discusses at length the development of the underlying thermodynamic equations and compares the results of different equations of state, the present report gives extensive tables of the thermodynamic properties of propane, propylene, n-butane and ethylene and also presents and explains the computer program which was used for the evaluation of the properties. In addition, the accuracy in the computations was improved; the presented tabulated data reflect this improvement.

E_0	= Equation of state coefficient
f	= fugacity
\tilde{f}	= Fugacity of component in a mixture
H	= Enthalpy
H^0	= Ideal gas enthalpy
H_0^0	= Absolute enthalpy
i	= Mixture component subscript
P	= Pressure
R	= Universal gas constant
S	= Entropy
S^0	= Ideal gas entropy at unit pressure
S_0^0	= Absolute entropy
T	= Temperature
X	= Quality

α = Equation of state coefficient
 γ = Equation of state coefficient
 ρ = Density

I. Description and Use of Tables

The thermodynamic properties of propane, propylene, n-butane and ethylene were calculated using Starling's equation of state. A previous investigation by Sallet and Wu (ref. 1) showed that the thermodynamic data of hydrocarbons which are currently available in the open technical literature are too inconsistent to be used for two-phase flow calculations necessary to properly size safety valves. In addition, Sallet and Wu (ref. 1) compared different equations of state and found that Starling's equation is best suited for the calculation of the thermodynamic data of hydrocarbons in the temperature and pressure regions which include compressed liquid states.

Saturation temperature tables are given for propane, propylene, n-butane, a 65% propane-25% propylene - 10% n-butane (by mole) mixture and ethylene. The mixture is treated as pseudo-fluid, as described by Sallet and Wu (ref. 1). The individual saturation temperature tables have two parts, in the first part the temperature, pressure, specific volume, enthalpy and entropy is listed and in the second part the temperature and pressures are repeated and the specific heat at constant pressure, the specific heat at constant volume and the sonic velocity is given. The saturation temperature tables give the thermodynamic properties at two degree Fahrenheit intervals within the following ranges: for propane, from -50°F to +196°F; for propylene from -50°F to 190°F, for n-butane, from -50°F to 294°F; for the propane mixture from -50°F to 164°F and for ethylene from -50°F to 42°F.

The thermodynamic properties in the superheated vapor region and the compressed liquid region were calculated for propane, propylene, n-butane,

and ethylene. The temperature intervals are 10 degrees Fahrenheit and the properties in the superheated vapor and compressed liquid regions are given in the same table, i.e. for a given temperature the properties are tabulated as a function of pressure. The pressure intervals are 10 psi with the lowest pressure selected being 10 psia.

Table III-1 Saturated Temperature Table of Propane

III. PRESENTATION AND DISCUSSION OF THE COMPUTER CODE

III-1 INTRODUCTION

The computer code for calculation of thermodynamic properties of propane and its mixtures, TAPPAM, is a group of Univac 1100, FORTRAN V subroutines, functions, main programs and block data subroutines written specifically for the accurate generation of data to be used in two-phase flow calculations. The thermodynamic equation of state developed by Starling et.al. (ref. 2) is used, with mixtures of up to, and including, three components allowed. Mixtures are treated as single component pseudo-fluids, to allow simple estimation of mixture two-phase flow rates. The code is in a modular form, to avoid unnecessary calculations and for simplification of additional programming.

The code has three major main programs which perform the following calculations:

VLEQUIL calculates vapor-liquid equilibrium conditions,

ISENTROP calculates thermodynamic data along isentropic lines to aid in calculation of isentropic flow rates,

COMPLIQ calculates thermodynamic properties in compressed liquid and superheated vapor regions of fluid behavior.

In addition, there is a minor main program, COEFFICTS, which performs curve fitting of thermodynamic reference data necessary to calculate enthalpy, entropy and specific heats.

There are four subroutines in TAPPAM. SECANT calculates solutions to an implicit form of the equation of state. The other three subroutines, ORTHLS, FITY and FITD, are used in the curve fitting and evaluation of thermodynamic reference data. ORTHLS is called by COEFFICTS to calculate coefficients for an orthogonal polynomial expansion of the reference data. FITY is called by some function routines to evaluate the expansion calculated by ORTHLS. FITD evaluates the derivative of the polynomial expansion. These three subroutines are exactly as described by Ries (ref.3), except for modification to allow double precision calculations.

There are seven double precision functions, each of which evaluates a single thermodynamic property; these functions are (the calculated property is given in parenthesis): FP (pressure), FF (mixture fugacity), FH (enthalpy), FS (entropy), FCP (constant pressure specific heat), FCV (constant volume specific heat) and FAS (sonic velocity squared). Density and temperature are the independent variables in all of these functions.

To complete the code, there is a collection of block data subroutines which give equation of state coefficients and reference data coefficients for propane, propylene, n-butane, a 65-25-10 percent by weight mixture of these three compounds, and ethylene. The proper data blocks are selected when a program is run to give thermodynamic properties of the desired fluid.

The purpose of the remainder of this chapter is to fully document the components of TAPPAM and to demonstrate the use of the code for thermodynamic calculations.

III-2 MAIN PROGRAMS

A. The program "VLEQUIL"

1. Description

This program calculates vapor-liquid equilibrium conditions for a mixture of up to three components. The user selects a periodic set of temperatures at which equilibrium information is desired. The program then solves for equilibrium at these temperatures by equating vapor pressures and fugacities to liquid pressures and fugacities. The procedure is as follows:

- a.) Select an approximation to the equilibrium pressure.
- b.) Calculate (by search and successive bisection) the liquid and gas densities predicted by the equation of state at the given temperature and pressure approximation.
- c.) Using these densities, calculate the fugacity of the liquid and the vapor phases.
- d.) Using ratio of liquid and vapor fugacities, calculate a new pressure approximation.
- e.) Repeat steps "b" through "d" until change in predicted pressure is small or until a specified number of iterations have been performed.

2. List of Variables

Variable Name	Units	Meaning
HLD1, HLD2, HLD3		Temporary Storage.
ALPHAH, BETAH, CH, JH, KH		Enthalpy reference data information; located in common block HREF.
ALPHAS, BETAS, CS, JS, KS		Entropy reference data information; located in common block SREF.
ALPHAC, BETAC, CC, JC, KC		Constant pressure specific heat reference data information; located in common block CPREF.
A0	$\frac{1bf - ft^6}{1b \cdot mole^2 \cdot in^2}$	Equation of state coefficient.
B0	$\frac{ft^3}{1b \cdot mole}$	Equation of state coefficient.
C0	$\frac{1bf - R^0 - ft^6}{1b \cdot mole^2 \cdot in^2}$	Equation of state coefficient.
D0	$\frac{1bf - R^0 - ft^6}{1b \cdot mole^2 \cdot in^2}$	Equation of state coefficient.
E0	$\frac{1bf - R^0 - ft^6}{1b \cdot mole^2 \cdot in^2}$	Equation of state coefficient.
A	$\frac{1bf - ft^9}{1b \cdot mole^3 \cdot in^2}$	Equation of state coefficient.
B	$\frac{ft^6}{1b \cdot mole^2}$	Equation of state coefficient.
C	$\frac{1bf - R^0 - ft^9}{1b \cdot mole^3 \cdot in^2}$	Equation of state coefficient.
D	$\frac{1bf - R^0 - ft^9}{1b \cdot mole^3 \cdot in^2}$	Equation of state coefficient.
ALPHA	$\frac{ft^9}{1b \cdot mole^3}$	Equation of state coefficient.
GAMMA	$\frac{ft^6}{1b \cdot mole^2}$	Equation of state coefficient.

R	$\frac{1\text{bf} - \text{ft}^3}{1\text{b mole} - R^0 - \text{in}^2}$	Universal gas constant.
XM	$\frac{1\text{b mass}}{1\text{b mole}}$	Molecular weight.
X1, X2, X3		Mole fractions of components in mixture.
A2, B2, C2, D2, ALPHA2, CGAMMA, ONETR, T2, T3, T4, T5, ADT, RT, CONVER		Combinations of equation of state coefficients, temperatures and constants used throughout program; located in common blocks PARA and TEMP.
NCOMP		Number of components in mixture.
NDATA		Number of data points to be generated.
T	$^{\circ}\text{R}$	Temperature.
DELT	R^0	Temperature increment.
PN	$\frac{1\text{bf}}{\text{in}^2}$	Equilibrium pressure approximation.
NUMBIT		Maximum number of iterations to find equilibrium conditions.
EPS1		Error bound on pressure (relative change per iteration).
EPS2		Error bound on density (relative change per iteration).
KNSRCH, NITER		Iteration parameters in solution of equation of state for density. Usually set to 1000.
XINT, XFIN	$\frac{1\text{b mole}}{\text{ft}^3}$	Density limits for search routine to solve equation of state. Usually set to 1.2 and .0001, respectively.
XLIQ, XGAS	$\frac{1\text{b mole}}{\text{ft}^3}$	Density of liquid and gas phases respectively.

FL, FG	$\frac{1bf}{in^2}$	Fugacities of liquid and gas phases, respectively.
PNN	$\frac{1bf}{in^2}$	New equilibrium pressure approximation.
P	$\frac{1bf}{in^2}$	Final, calculated equilibrium pressure.
HЛИQ, HGAS	$\frac{BTU}{1b \text{ mass}}$	Enthalpy of liquid and gas phases, respectively.
SLIQ, SGAS	$\frac{BTU}{1b \text{ mass} - R^0}$	Entropy of liquid and gas phases, respectively.
CPLIQ, CPGAS	$\frac{BTU}{1b \text{ mass} - R^0}$	Constant pressure specific heat of liquid and gas phases, respectively.
CVLIQ, CVGAS	$\frac{BTU}{1b \text{ mass} - R^0}$	Constant volume specific heat of liquid and gas phases, respectively.
ASLIQ, ASGAS	$\frac{ft}{sec}$	Sonic velocity of liquid and gas phases, respectively.
RAT		Ratio of specific heats (C_p/C_v).
TF	$^{\circ}F$	Temperature.

3. Input, Output and Format

a. Input and Format

Card Number	Data	Format
1	Number of Components.	I1
2	Number of Equilibrium Points Desired.	I3
3	Initial Temperature ($^{\circ}R$), Temperature Increment (R°).	2D12.6
4	Initial Equilibrium Pressure Approximation (psia).	D12.6
5	Pressure Error Bound, Density Error Bound, KNSRCH, NITER, NUMBIT, XINT ($1b \text{ mole}/ft^3$), XFIN ($1b \text{ mole}/ft^3$).	2D12.6, 315, 2D12.6

b. Output and Format

The program outputs to three devices. Unit number six is a line printer. Units ten and eleven are user defined data files.

i. Output and Format to Unit Six

Line Number	Data	Format
odd	Pressure (psia), Temperature ($^{\circ}$ F), Liquid and Vapor Phase Specific Volume (ft 3 /lb mass), Liquid and Vapor Phase Enthalpy (BTU/lb mass), Liquid and Vapor Phase Entropy (BTU/lb mass/R 0).	2X,8(D12.6,2X)
even	Liquid and Vapor Phase Constant Pressure Specific Heats (BTU/lb mass/ R 0), Liquid and Vapor Phase Constant Volume Specific Heats (BTU/lb mass/R 0), Liquid and Vapor Phase Sonic Velocities (ft/sec).	2X,6(D12.6,2X)

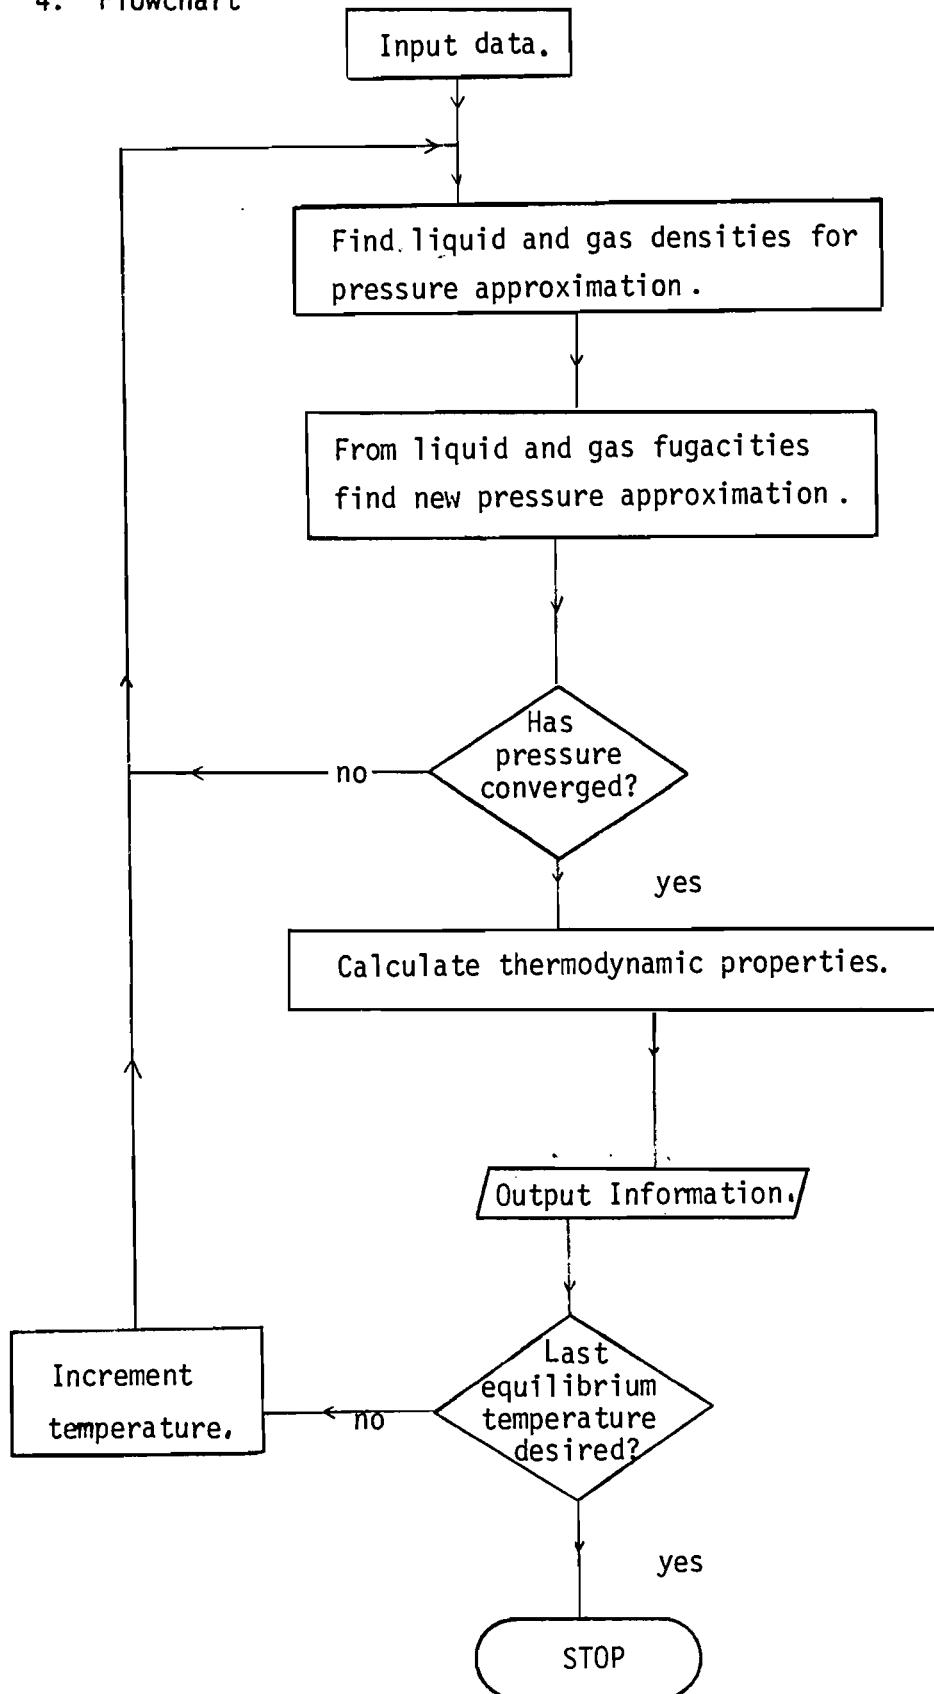

ii. Output and Format to Unit Ten

Line Number	Data	Format
odd	Pressure (psia), Temperature ($^{\circ}$ F), Liquid and Vapor Phase Specific Volume (ft 3 /lb mass).	4(D18.12,2X)
even	Liquid and Vapor Phase Enthalpy (BTU/lb mass), Liquid and Vapor Phase Entropy (BTU/lb mass/R 0).	4(D18.12,2X)

iii. Output and Format to Unit Eleven

Line Number	Data	Format
odd	Pressure (psia), Temperature ($^{\circ}$ F), Liquid and Vapor Constant Pressure Specific Heat (BTU/lb mass/R 0).	4(D18.12,2X)
even	Liquid and Vapor Phase Constant Volume Specific Heat (BTU/lb mass/ R 0), Liquid and Vapor Phase Sonic Velocity (ft/sec).	4(D18.12,2X)

4. Flowchart

B. The Program "ISENTROP"

1. Description

This program calculates thermodynamic properties along isentropic lines in single phase regions of fluid behavior, from a given thermodynamic state specified by pressure and temperature. The user selects initial pressure and temperature, from which the program calculates the remaining thermodynamic properties. The user then inputs temperatures, and, using these temperatures and the entropy of the initial state, the thermodynamic properties are found. The equations of state (pressure - temperature - density and entropy - temperature - density) are solved for densities using a search technique followed by successive bisections. Thermodynamic properties are then calculated directly from the equation of state.

2. List of Variables

Variable Name	Units	Meaning
ALPHAE, BETAE, CE, JE, KE		Coefficients for entropy calculation; located in common block SREF.
ALPHAH, BETAH, CH, JH, KH		Coefficients for enthalpy calculation; located in common block HREF.
A0, B0, C0, D0, E0, A, B, C, D, ALPHA, GAMMA, R, XM, XINT, XFIN, KNSRCH, NITER, T2, T3, T4, T5, ADT, RT		See section II A 2.
P0	$\frac{\text{lbf}}{\text{in}^2}$	Initial pressure .
T0	$^{\circ}\text{R}$	Initial temperature .
EPS		Relative maximum error in calculating densities.
X0	$\frac{\text{lb mole}}{\text{ft}^3}$	Initial density.
X00	$\frac{\text{lb mass}}{\text{ft}^3}$	Initial density .

H0	$\frac{\text{BTU}}{1\text{b mass}}$	Initial enthalpy.
S0	$\frac{1\text{bf} - \text{ft}^3}{\text{in}^2 - 1\text{b mole} - R^0}$	Initial entropy.
S00	$\frac{\text{BTU}}{1\text{b mass} - R^0}$	Initial entropy.
TOT	${}^0\text{F}$	Initial temperature.
T	${}^0\text{R}$	Desired temperature.
X	$\frac{1\text{b mole}}{\text{ft}^3} \left(\frac{1\text{b mass}}{\text{ft}^3} \right)$	Density at desired temperature and initial entropy.
P	$\frac{1\text{bf}}{\text{in}^2}$	Pressure at desired temperature and initial entropy.
H00	$\frac{\text{BTU}}{1\text{b mass}}$	Enthalpy at desired temperature and initial entropy.

3. Input, Output and Format

a. Input and Format

Card Number	Data	Format
1	Initial pressure and temperature.	Open
2	EPS, KNSRCH, NITER, XINT, XFIN.	Open
3	Desired temperature.	Open
4	Desired temperature.	Open
n	Last desired temperature.	Open
n+1	@EOF	@ in column number one.

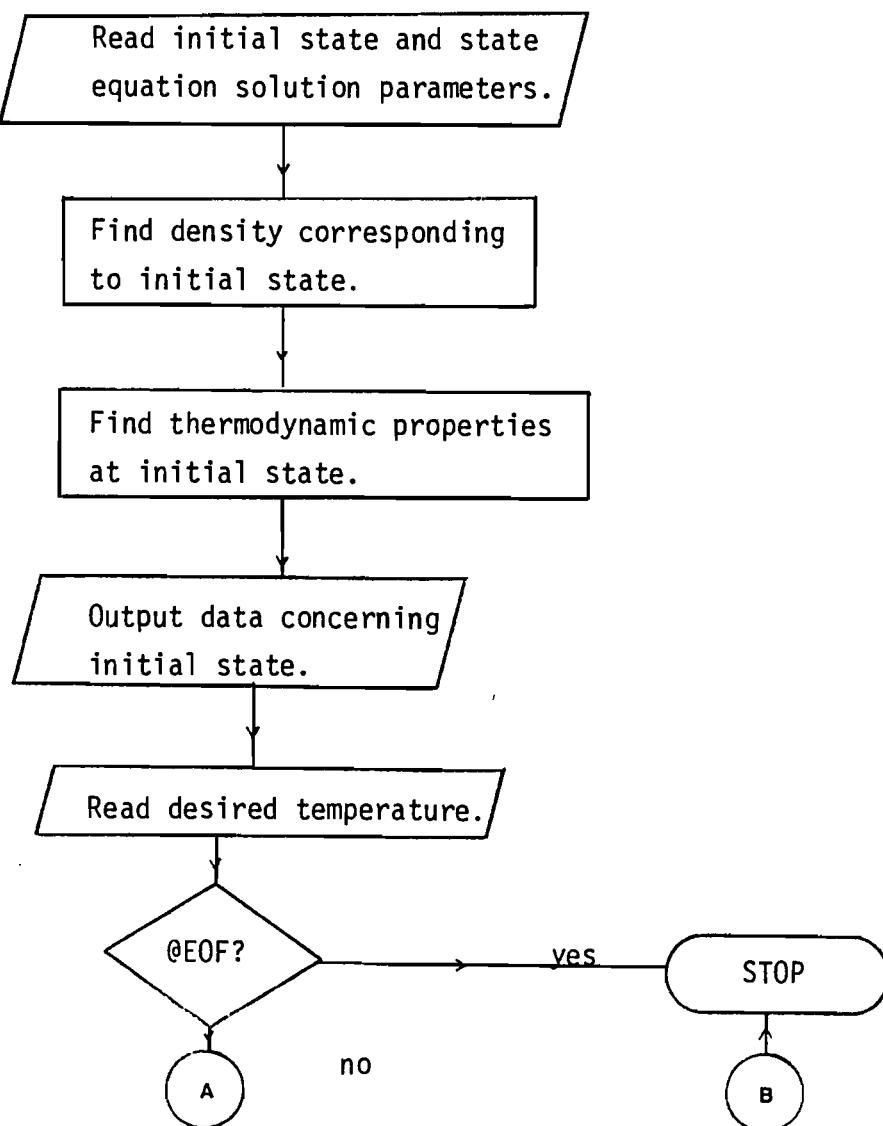

b. Output and Format

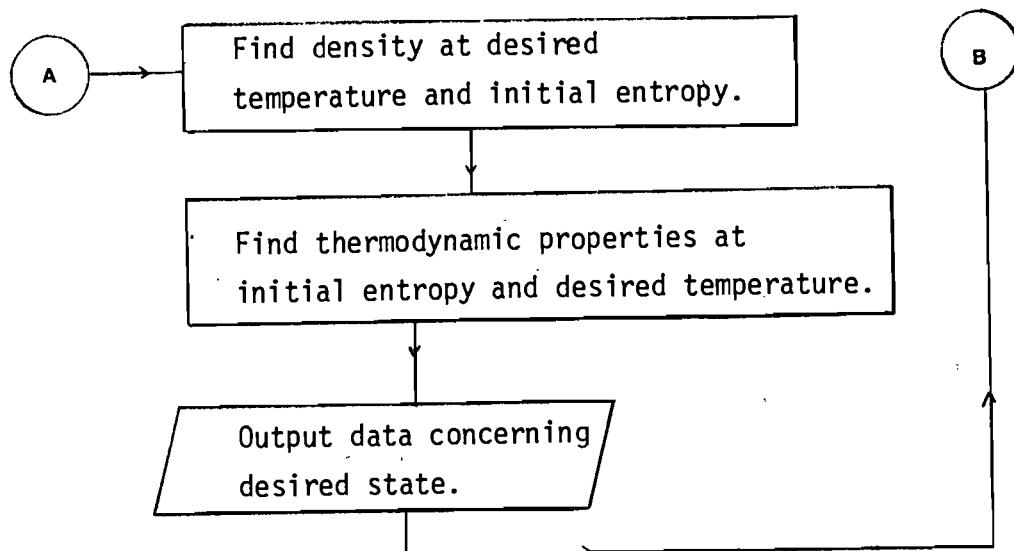

All output is printed on unit number six, a line printer.

Line Number

1	Initial pressure (psia), temperature ($^{\circ}$ F), density (lb mass/ft 3), enthalpy (BTU/lb mass), and entropy (BTU/lb mass - R $^{\circ}$).	1X,5(D14.8,1X)
2	Desired pressure, temperature, density, enthalpy and entropy in same units as line number 1.	1X,5(D14.8,1X)
n-1	Same as line 2 for last desired temperature.	1X,5(D14.8,1X)

4. Flowchart

C. The program "COMPLIQ"

1. Description

This program finds thermodynamic properties in the compressed liquid and superheated vapor regions at states specified by pressure and temperature. The pressure and temperature are input by the user and, using a search method followed by successive bisection, the pressure - temperature - density equation of state is solved for density. Thermodynamic properties are then calculated directly. If the desired state is compressed liquid then XINT greater than XFIN is input. For superheated vapor regions XINT should be less than XFIN.

2. List of Variables

Variable Name	Units	Meaning
A0, BO, CO, DO, EO, A, B, C, D, ALPHA, GAMMA, R, XM, HLD1, HLD2, T2, T3, T4, T5, ADT, RT, CONVER	See section II A 2.	See section II A 2.
X	$\frac{1\text{b mole}}{\text{ft}^3} \left(\frac{1\text{b mass}}{\text{ft}^3} \right)$	Density.
H	$\frac{\text{BTU}}{1\text{b mass}}$	Enthalpy.

S	$\frac{\text{BTU}}{1\text{b mass} - \text{R}^0}$	Entropy.
P	$\frac{1\text{bf}}{\text{in}^2}$	Pressure.
T	$^{\circ}\text{R}$	Temperature.
CP	$\frac{\text{BTU}}{1\text{b mass} - \text{R}^0}$	Constant pressure specific heat.
CV	$\frac{\text{BTU}}{1\text{b mass} - \text{R}^0}$	Constant volume specific heat.
AS	$\frac{\text{ft}}{\text{sec}}$	Sonic velocity.

3. Input, Output and Format

a. Input and Format

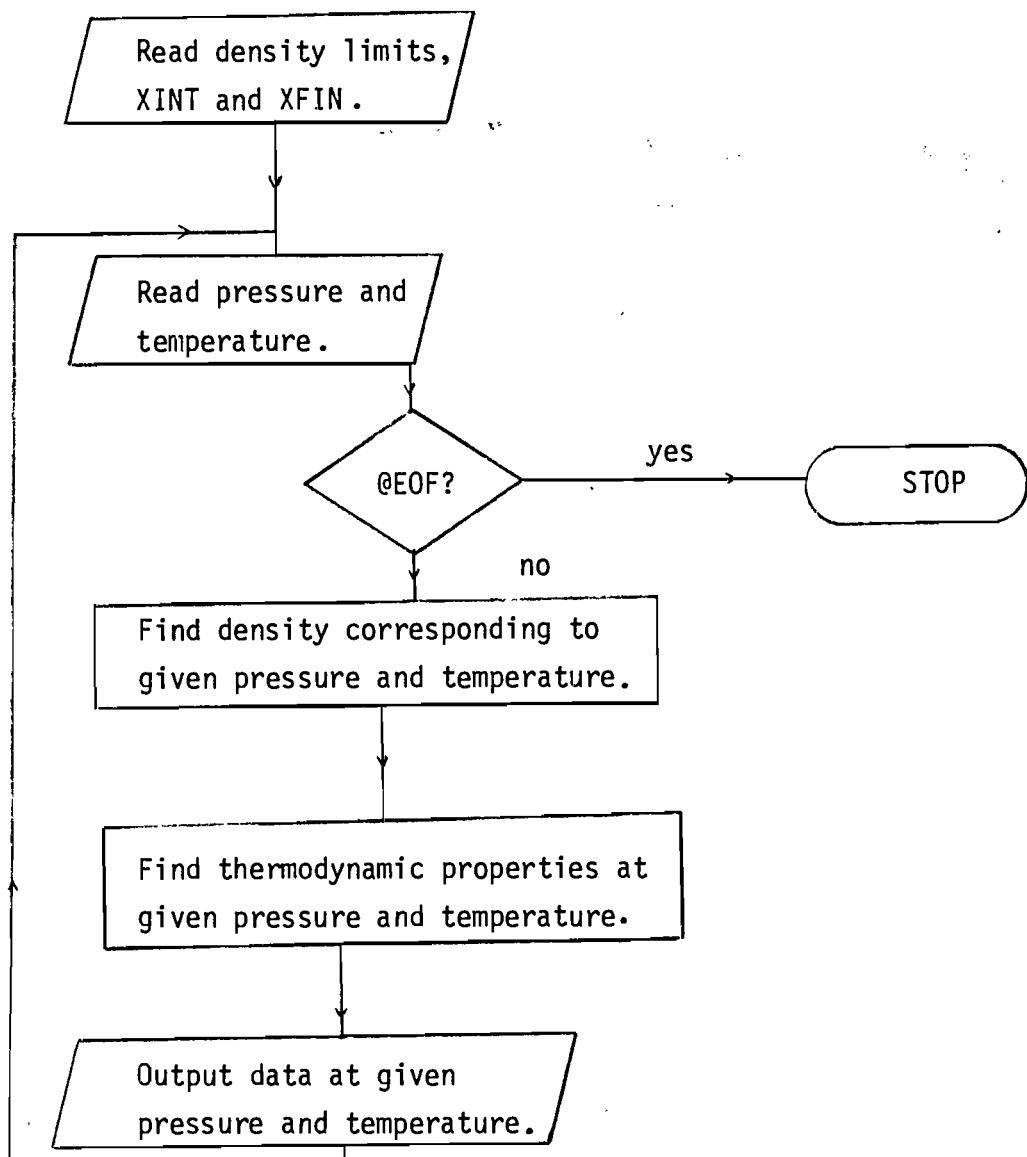

Card Number	Data	Format
1	XINT, XFIN	Open
2	Desired pressure $\left(\frac{1\text{bf}}{\text{in}^2}\right)$ and temperature ($^{\circ}\text{R}$).	Open
n	Last desired pressure $\left(\frac{1\text{bf}}{\text{in}^2}\right)$ and temperature.	Open
n+1	@EOF	@ in column number one.

b. Output and Format

All output is to unit number six, a line printer.

Line Number	Data	Format
1	Pressure ($\frac{1bf}{in^2}$), temperature (0R), density (lb mass/ ft^3), enthalpy BTU/lb mass), entropy (BTU/lb mass - R^0), constant pressure and volume specific heats (BTU/lb mass - R^0) and sonic velocity (ft/sec).	4(D14.8,1X),/, 4(D14.8,1X)
n-1	Same as line 1 for last desired state.	Same as line 1.

4. Flowchart

D. The program "COEFFICTS"

1. Description

This program determines a least square orthogonal polynomial approximation to the reference values of enthalpy, entropy and specific heat of a mixture, given a series of reference value versus temperature points and mole fraction of each component. The program then outputs the statements necessary to create a block data subroutine containing the polynomial coefficients and absolute reference point.

The user inputs the number of components and mole fraction of each component, followed by the name of the common block to be used in creating the block data subroutine. In creating the block data subroutines for TAPPAM, HREF, SREF and CPREF were used for enthalpy, entropy and constant pressure specific heat reference value common block names. The reference value versus temperature points are then read for the major component, followed by the information for the minor components. A mole weighted average of the reference values is then calculated and the orthogonal polynomial curve fit is applied. It is not necessary that the input data for each component be at the same temperatures, since the program automatically calculates interpolating polynomials which are evaluated to arrive at a series of reference values for each component at the temperatures supplied with the major component. When absolute reference values are needed (such as for enthalpy) these are also calculated.

2. List of Variables

Variable Name	Units	Meaning
XM		Mole fractions.
T	$^{\circ}$ R	Temperature of major component.
P	(BTU, 1b mole, R $^{\circ}$)	Reference value for major component.
T2	$^{\circ}$ R	Temperature of minor component.
P2	(BTU, 1b mole, R $^{\circ}$)	Reference value for minor component.

Z1, Z2, Z3, W		Temporary storage.
NAME		Common block name of output.
ALPHAE, BETAE, CE		Calculated coefficients for orthogonal polynomial expansion.
NUMB		Number of components in mixture.
N1		Number of reference value points for major components.
K1		Order of polynomial curve fit for final output. (usually set to nine)
J1		Number of low order coefficients in polynomial to be set to zero. (usually set to zero)
P001	(BTU, 1b mole, R°)	Absolute reference value of major component. If none is needed, set to zero.
N,P00		Corresponding to N1 and P001 for minor components.
J,K		Corresponding to J1, K1 for interpolating polynomial for minor component.

3. Input, Output and Format

a. Input and Format

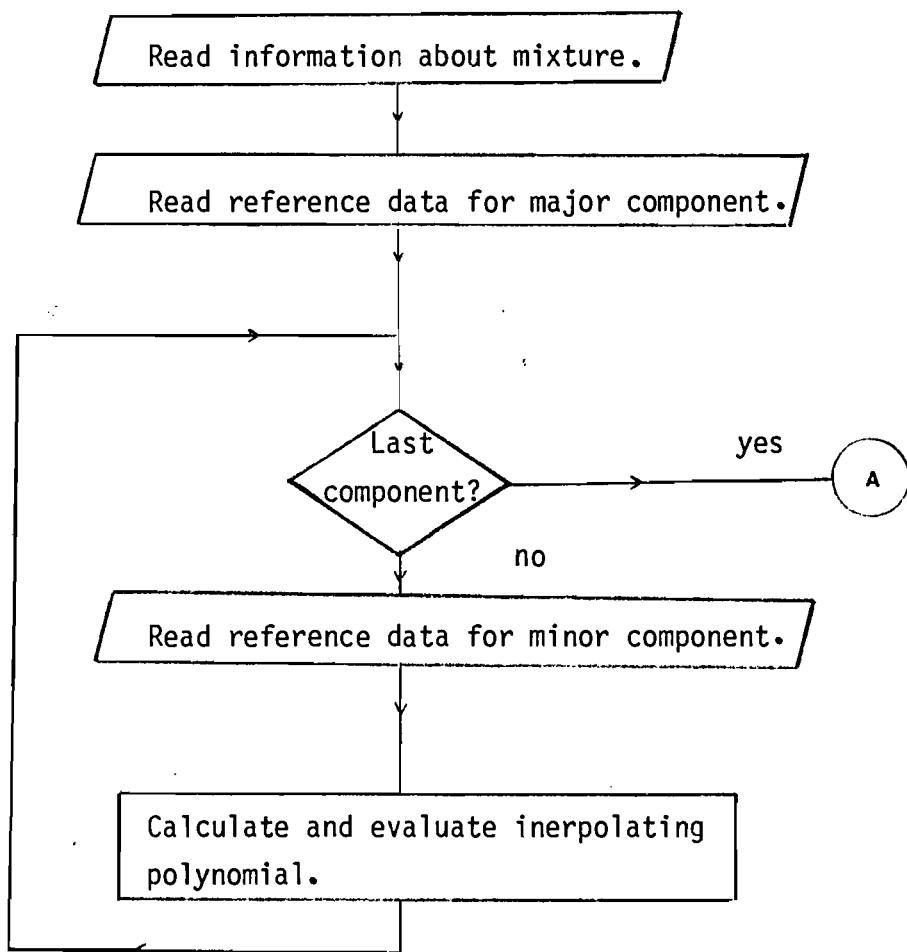

Card Number	Data	Format
1	Number of components.(NUMB)	I2
2	Mole fraction of major component.	F10.8
3	Mole fraction of minor component.	F10.8
NUMB+1	Mole fraction of last component.	F10.8
NUMB+2	Name of output common block.	A6
NUMB+3	N1, K1 and J1	I2, 2I1
NUMB+4	T(1) (⁰ R) and P(1), (per 1b mole)	2F20.10

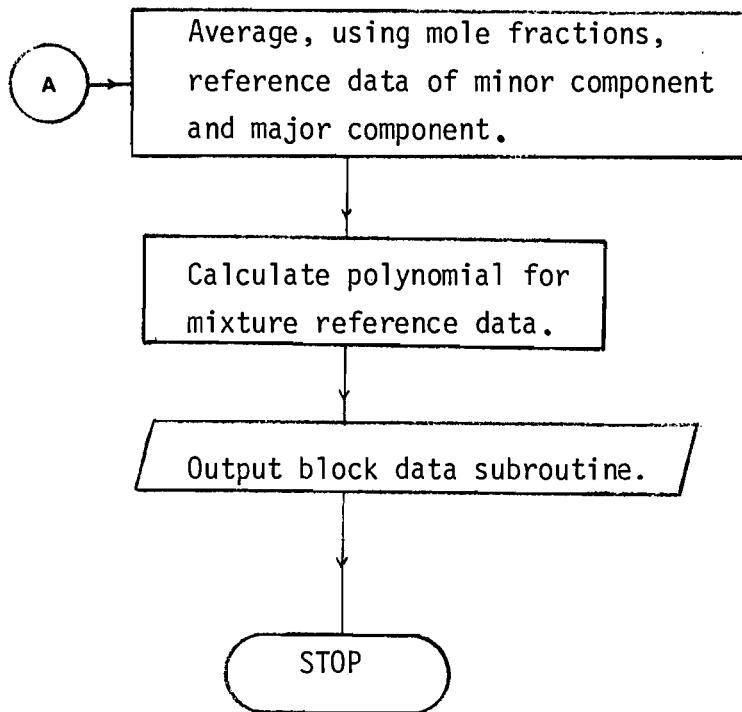

NUMB+N1+3	T(N1) and P(N1)	2F20.10
NUMB+N1+4	P001 (per 1b mole)	F20.10
NUMB+N1+5	N, K and J for next component.	I2, 2I1
	etc.	

b. Output and Format

This program actually creates as its output another program; a block data subroutine. For an example of output and format see section VI D.

4. Flowchart

III-3 SUBROUTINES

A. The Subroutines "ORTHLS," "FITY," and "FITD."

The three subroutines ORTHLS, FITY and FITD, compute and evaluate a least square orthogonal polynomial fit to a series of data points. Knowledge of these subroutines for the usage of TAPPAM is not necessary. For a complete description of their use see Ries (ref. 3). For a description of their use for this application, see Wu (ref. 4).

B. The Subroutine "SECANT"

I. Description

This subroutine solves for the zero of a function of three variables, with two variables fixed. Given are the values XINT and XFIN, as values of the free variable, and the values T and P of the fixed variables;

the subroutine first divides the interval ($XINT$, $XFIN$) into KN equally spaced subintervals. The function is then evaluated at the endpoints of each subinterval (starting with $(XINT, XINT + \frac{XFIN - XINT}{KN})$) until the function values at each endpoint are of different sign. This guarantees a root of the function (assuming continuity) in the subinterval. This algorithm is the classical search method of rooting functions. The subinterval is then bisected a maximum of $NITER$ times, each time determining a new subinterval containing the root of the function. If the size of the interval relative to the interval center is equal to or less than EPS , the routine is considered to have converged, and the center value of the interval returned to the calling program as the root.

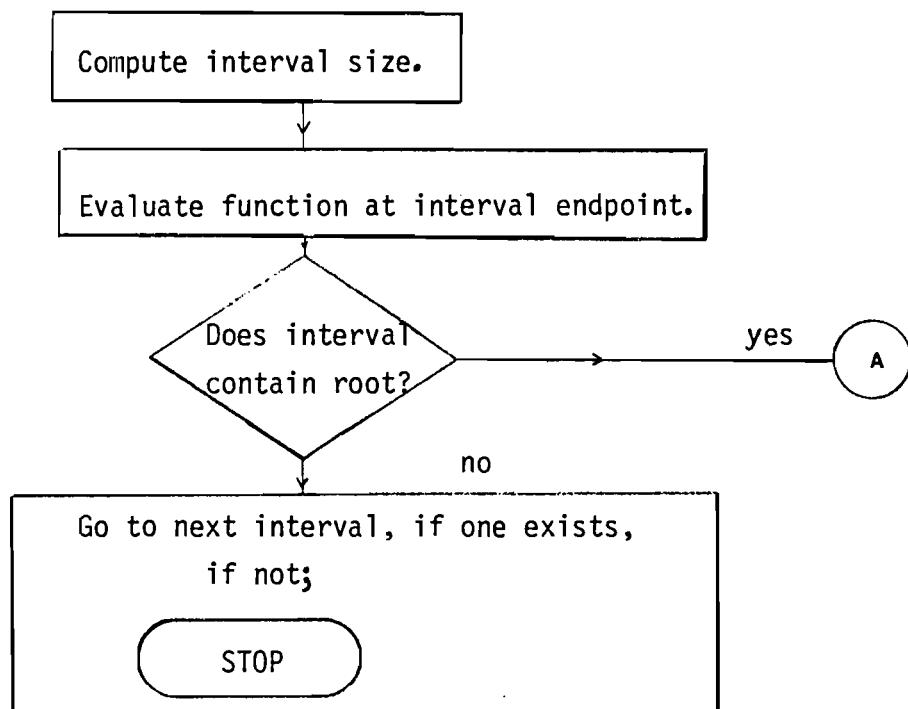

In using this subroutine with the functions in TAPPAM, density is the free variable and temperature and a dependent thermodynamic variable are fixed. To find a liquid solution, $XINT$ must be greater than $XFIN$. For solutions in the superheated vapor region, the opposite must be true.

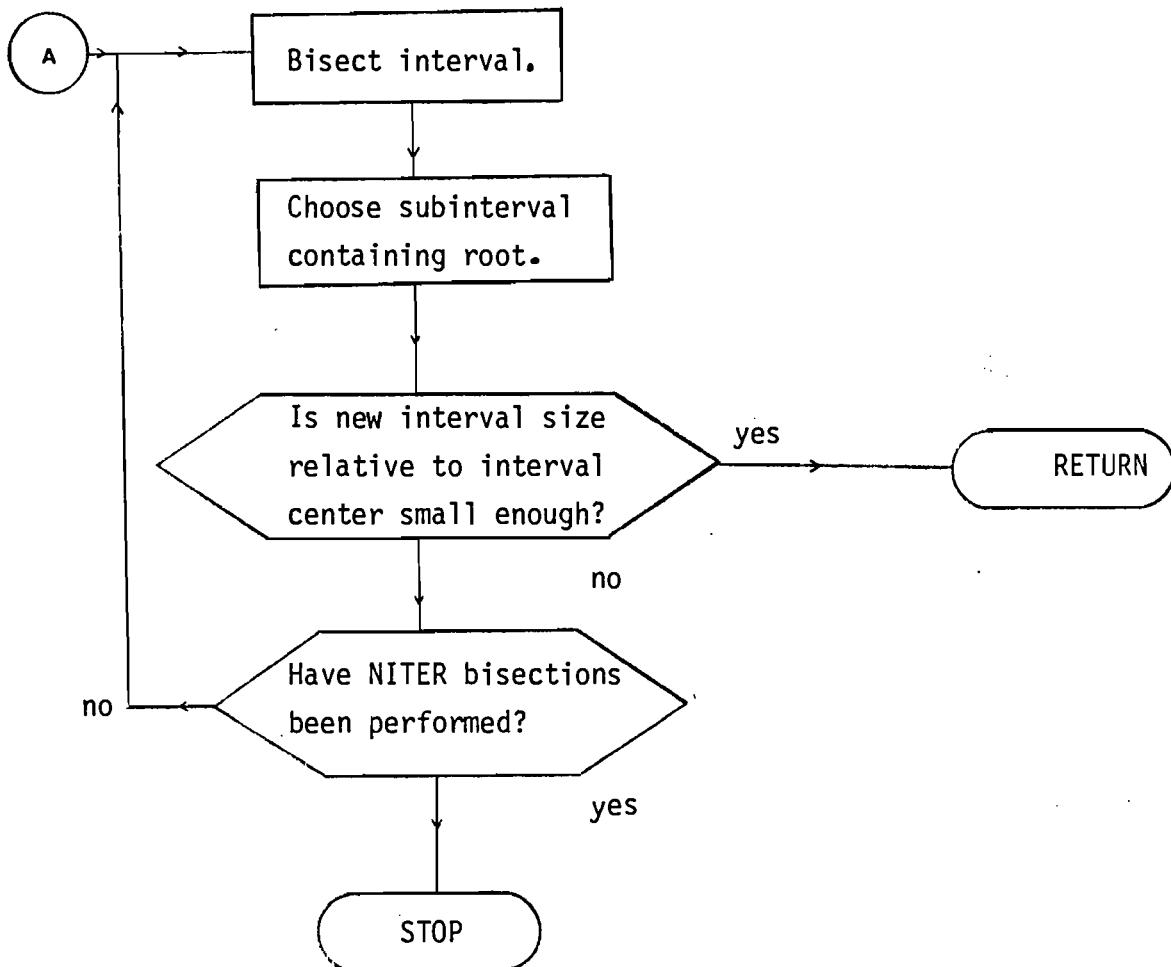

2. List of Variables

Variable Name	Units	Meaning
$XINT$	$\frac{\text{lb mole}}{\text{ft}^3}$	Initial value of search routine.
$XFIN$	$\frac{\text{lb mole}}{\text{ft}^3}$	Final value of search routine.
FS		Name of function to be rooted.
KN		Number of search intervals.
SO		Fixed value of dependent thermodynamic variable.
T	$^{\circ}\text{R}$	Fixed temperature.
X	$\frac{\text{lb mole}}{\text{ft}^3}$	Final root of function.
NITER		Maximum number of allowed bisections.
EPS		Desired relative error of density.
ERROR		Error parameter giving approximate value of function at calculated density.

DX	$\frac{1\text{b mole}}{\text{ft}^3}$	Size of search intervals.
X1	$\frac{1\text{b mole}}{\text{ft}^3}$	Initial value of density in sub-interval.
X2	$\frac{1\text{b mole}}{\text{ft}^3}$	Final value of density in sub-interval.
F1		Value of function at X1.
F2		Value of function at X2.
XM	$\frac{1\text{b mole}}{\text{ft}^3}$	Midpoint of interval.
FM		Value of function at XM.

3. Flowchart

III-4 FUNCTIONS

A. The Function "FP"

The function used for evaluation of pressure is: (see Starling, et al. (ref. 1))

$$\begin{aligned}
 FP = & \rho RT + \left(B_0 RT - A_0 - \frac{C_0}{T^2} + \frac{D_0}{T^3} - \frac{E_0}{T^4} \right) \rho^2 \\
 & + \left(bRT - a - \frac{d}{T} \right) \rho^3 + \alpha \left(a + \frac{d}{T} \right) \rho^6 \\
 & + \frac{C\rho^3}{T^2} (1 + \gamma\rho^2) \exp(-\gamma\rho^2) - P
 \end{aligned}$$

The variables, their units and their meanings are:

Variable Name	Units	Meaning
X	$\frac{lb \text{ mole}}{ft^3}$	Density.
T	$^{\circ}\text{R}$	Temperature.
P	$\frac{lbf}{in^2}$	Pressure.
A0, B0, C0, D0, E0, A, B, C, D, ALPHA, GAMMA, R, T2, T3, T4, T5, ADT, RT		See section II A 2.
X2	$\frac{lb \text{ mole}^2}{ft^6}$	Density squared.
X3	$\frac{lb \text{ mole}^3}{ft^9}$	Density cubed.
X6	$\frac{lb \text{ mole}^6}{ft^{18}}$	Density to the sixth power.

B. The Function "FF"

The function used to evaluate the fugacity of a mixture is:(see Wu ref. 4)

$$FF = \exp \left(\sum_{i=1}^n x_i \ln \frac{f_i}{x_i} \right)$$

where

$$\begin{aligned}
RT \ln \bar{f}_i &= RT \ln (\rho RT x_i) + \rho (B_0 + B_{0i}) RT + 2\rho \sum_{j=1}^n x_j \left[-(A_{0j} A_{0i})^{1/2} \right. \\
&\quad \left. - \frac{(C_{0j} C_{0i})^{1/2}}{T^2} + \frac{(D_{0j} D_{0i})^{1/2}}{T^3} - \frac{(E_{0j} E_{0i})^{1/2}}{T^4} \right] \\
&\quad + \frac{\rho^2}{2} \left[3(b^2 b_i)^{1/3} RT - 3(a^2 a_i)^{1/3} - \frac{3(d^2 d_i)^{1/3}}{T} \right] \\
&\quad + \frac{\alpha \rho^5}{5} \left[3(a^2 a_i)^{1/3} + \frac{3(d^2 d_i)^{1/3}}{T} \right] + \frac{3\rho^5}{5} \left(a + \frac{d}{T} \right) (\alpha^2 \alpha_i)^{1/3} \\
&\quad + \frac{3(c^2 c_i)^{1/3} \rho^2}{T^2} \left[\frac{1 - \exp(-\gamma \rho^2)}{\gamma \rho^2} - \frac{\exp(-\gamma \rho^2)}{2} \right] \\
&\quad - \frac{2c}{\gamma T^2} \left[\frac{\gamma i}{\gamma} \right]^{1/2} \{1 - \exp(-\gamma \rho^2)[1 + \gamma \rho^2 + \frac{1}{2} \gamma^2 \rho^4]\}
\end{aligned}$$

The variables, their units and their meanings are:

Variable Name

X, T, X2	see section IV A.
NCOMP	Number of components in mixture.
A00, B00, C00, D00, E00, AA, BB, CC, DD, ALPALP, GAMGAM	Equation of state coefficients.
XX	Mole fractions of mixture components.
A0, B0, C0, D0, E0, A, B, C, D, ALPHA, GAMMA, R, XM, A2, B2, C2, D2, ALPHA2, CGAMMA, ONETR, T2	See section II A 2.
T3, T4, T5, ADT, RT	
X4	$\frac{1 \text{b mole}^4}{\text{ft}^{12}}$ Density to fourth power.

X5	$\frac{1 \text{b mole}^5}{\text{ft}^{15}}$	Density to fifth power.
XRT	$\frac{1 \text{bf}}{\text{in}^2}$	Product of density and RT.
GX2		Product of Gamma and X2.
GX22		GX2 squared.
EXPP, EXP1, EXP2, FFF, ADCOMB, SUM		Temporary storage.
FF	$\frac{1 \text{bf}}{\text{in}^2}$	Fugacity of mixture.

C. The function "FH".

The function used to evaluate enthalpy is: (see Wu ref. 4)

$$\begin{aligned}
 FH = & \left[B_0 RT - 2A_0 - \frac{4C_0}{T^2} + \frac{5D_0}{T^3} - \frac{6E_0}{T^4} \right] \rho \\
 & + \frac{1}{2} \left(2bRT - 3a - \frac{4d}{T} \right) \rho^2 + \frac{1}{5} \alpha \left(6a + \frac{7d}{T} \right) \rho^5 \\
 & + \frac{C}{T^2} [3 - (3 + \frac{1}{2} \gamma \rho^2 - \gamma^2 \rho^4) \exp(-\gamma \rho^2)]
 \end{aligned}$$

$$(H^0 - H_0^0) + H_0^0 - H$$

The variable used, their units and their meanings are:

Variable Name	Units	Meaning
X, T, X2		See section IV A.
A0, B0, C0, D0, E0, A, B, C, D, ALPHA, GAMMA, R, XM, T2, T3, T4, T5, ADT, RT		See section II A 2.
H	$\frac{1 \text{bf} - \text{ft}^3}{\text{in}^2 - 1 \text{b mole}}$	Enthalpy.

ALPHAE, BETAE, CE, JE, KE		Reference value coefficients for enthalpy; located in common block HREF.
HOO	BTU 1b mole	Absolute enthalpy reference value.
X5		See section IV B.
Z1, Z2, Z3, Z4, Z5, T1, TT2, TT, DEL		Temporary storage.

D. The Function "FS"

The function used to evaluate entropy is: (see Wu ref. 4)

$$\begin{aligned}
 FS = & -R \ln \rho RT - \left(B_0 R + \frac{2C_0}{T^3} - \frac{3D_0}{T^4} + \frac{4E_0}{T^5} \right) \rho - \frac{1}{2} \left(bR + \frac{d}{T^2} \right) \rho^2 \\
 & + \frac{\alpha \rho^5 d}{5T^2} + \frac{2C}{\gamma T^3} \left[1 - \left[1 + \frac{1}{2} \gamma \rho^2 \right] \exp(-\gamma \rho^2) \right]
 \end{aligned}$$

$$(S_0 - S_0^0) + S_0^0 - S$$

The variables, their units and their meanings are:

Variable Name	Units	Meaning
X, T, X2		See section IV A.
S	lbf - ft in ² - 1b mole - R ⁰	Entropy.
ALPHAE, BETAE, CE, JE, KE		Entropy reference coefficients; located in common block SREF.
A0, B0, C0, D0, E0, A, B, C, D, ALPHA, GAMMA, R, XM, T2, T3, T4, T5, ADT, RT		See section II A 2.
TT, T1, TT2, Z1, Z2, Z3, Z4, Z5, Z6, DEL		Temporary storage.

E. The Function "FCP"

The function for evaluation of constant pressure specific heat is:
 (see Wu ref. 4. The equation should read as follows.)

$$\begin{aligned} FCP &= -R + \left[\frac{6C_0}{T^3} - \frac{12D_0}{T^4} + \frac{20E_0}{T^5} \right] \rho + \frac{d}{T^2} \rho^2 \\ &\quad - \frac{2}{5} \frac{\alpha d}{T^2} \rho^5 + \frac{6C}{\gamma T^3} \left[e^{-\gamma \rho^2} - 1 \right] + \frac{3C}{T^3} \rho^2 e^{-\gamma \rho^2} + (\bar{P}) + C_p^* - C_p \end{aligned}$$

where (\bar{P}) is

$$\frac{T R + \rho \left(B_0 R + \frac{2C_0}{T^3} - \frac{3D_0}{T^4} + \frac{4E_0}{T^5} \right) + \rho^2 \left(bR + \frac{d}{T^2} \right) - \frac{\alpha d \rho^5}{T^2} - \frac{2c \rho^2}{T^3} (1 + \gamma \rho^2) \exp(-\gamma \rho^2)^2}{\text{denominator}}$$

where the denominator is

$$\begin{aligned} &\{ RT + 2 \left(B_0 RT - A_0 - \frac{C_0}{T^2} + \frac{D_0}{T^3} - \frac{E_0}{T^4} \right) \rho + 3\rho^2 \left(bRT - a - \frac{d}{T} \right) \\ &\quad + 6\alpha \rho^5 (a + \frac{d}{T}) + \frac{C \rho^2}{T^2} (3 + 3\gamma \rho^2 - 2\gamma^2 \rho^4) \exp(-\gamma \rho^2) \} \end{aligned}$$

The variables, their units and their meanings are:

Variable Name	Units	Meaning
CP	$\frac{1\text{bf} \cdot \text{ft}}{\text{in}^2 \cdot \text{lb mole} \cdot \text{R}^0}^3$	Constant pressure specific heat.
X, T, X2		see section IV A.
X5		see section IV B.

ALPHAE, BETAE,
CE, JE, KE

Reference value coefficients
for constant pressure
specific heat; located in
common block CPREF.

TT1, TT2, TR,
DEL, Z1, Z2, Z3,
Z4, Z5, Z6, DEX,
CPP, ADD1, DIVI

A0, B0, CO, DO,
EO, A, B, C, D,
ALPHA, GAMMA, R,
T2, T3, T4, T5,
ADT, RT, XM

Temporary storage.

see section II A 2.

F. The Function "FCV"

The function used for evaluation of constant volume specific heat is:

$$FCV = -R + \left(6 \frac{C_0}{T^3} - 12 \frac{D_0}{T^4} + 20 \frac{E_0}{T^5}\right) \rho + \frac{d}{T^2} \left(\rho^2 - \frac{2}{5} \alpha \rho^5\right) + \frac{3C}{\gamma T^3} [-2 + \{2 + \gamma \rho^2\} \exp(-\gamma \rho^2)] - C_v + \left(\frac{\partial H_0}{\partial T}\right)$$

The variables, their units and their meanings are:

Variable Name	Units	Meaning
X, T, X2, X3		see section IV A.
ALPHAE, BETAE, CE, JE, KE		Reference value coefficients for enthalpy; located in common block HREF.
CV	$\frac{1bf \cdot ft^3}{in^2 \cdot lb \cdot mole \cdot R^0}$	Constant volume specific heat.
TT1, TT2, TR, DEL, GAMXX, Z1, Z2, Z3		Temporary storage.

G. The Function "FAS"

The function used to evaluate the sonic velocity squared is:

$$\begin{aligned}
 FAS = & C_p/C_v \{ RT + 2(B_0 RT - A_0 - C_0/T^2 + D_0/T^3 - E_0/T^4)\rho \\
 & + 3(bRT - a - d/T)\rho^2 + 6\alpha(a + d/T)\rho^5 \\
 & + \frac{c\rho^2}{T^2} (2\gamma\rho^2 + (3 - 2\gamma\rho^2)(1 + \gamma\rho^2)) \exp(-\gamma\rho^2) \} - a_s^2
 \end{aligned}$$

The variables, their units and their meanings are:

Variable Name	Units	Meaning
X, T, X2		see section IV A.
X5		see section IV C.
AS	$\frac{\text{lbf} - \text{ft}^3}{\text{lb mole} - \text{in}^2}$	Sonic velocity squared.
GAMMXX, Z1, Z2, Z3, Z4		Temporary storage.
RAT		Ratio of constant pressure to constant volume specific heats.
A0, B0, C0, D0, E0, A, B, C, D, ALPHA, GAMMA, R		see section II A 2.

III-5 BLOCK DATA SUBROUTINES

There are seven common blocks used in TAPPAM which contain information about the fluid whose properties are desired. The first of these is COEFF, which contains the coefficients of the equation of state, the molecular weight of the fluid, the universal gas constant and the mole fractions of the constituents of a mixture. If a mixture is used, the common blocks COEFF1, COEFF2 and COEFF3 must contain the equation of state coefficients of the mixture components.

The common blocks HREF, SREF and CPREF contain the information generated by COEFFICTS for evaluating reference values of enthalpy, entropy and constant pressure specific heat, respectively.

In order to initialize the values in the common blocks when a program is run, block data subroutines have been used. Twenty four block data subroutines are given here, containing information about propane, propylene, n-butane, a 65-25-10 percent by mole weight mixture of these three compounds and ethylene.

A list of the subroutine names, the common block which they initialize and the fluid they describe is:

Subroutine Name	Common Block	Fluid
PROPCOEFF	COEFF	Propane
PROPLCOEFF	COEFF	Propylene
NBUTCOEFF	COEFF	N-butane
MIXCOEFF	COEFF	Mixture
MIXCOEFF1	COEFF1	Propane
MIXCOEFF2	COEFF2	Propylene
MIXCOEFF3	COEFF3	N-butane
PROPHREF	HREF	Propane
PROPLHREF	HREF	Propylene
NBUTHREF	HREF	N-butane
MIXHREF	HREF	Mixture
PROPSREF	SREF	Propane
PROPLSREF	SREF	Propylene
NBUTSREF	SREF	N-butane
MIXSREF	SREF	Mixture
PROPCPREF	CPREF	Propane
PROPLCPREF	CPREF	Propylene
NBUTCPREF	CPREF	N-butane
MIXCPREF	CPREF	Mixture
LINHOPKECOEFF	COEFF	Propane
ETHLCOEFF	COEFF	Ethylene
ETHLHREF	HREF	Ethylene
ETHLSREF	SREF	Ethylene
ETHLCPREF	CPREF	Ethylene

III-6 EXAMPLES

A. Use of the Program "VLEQUIL"

Consider the following problem; it is desired to know vapor-liquid equilibrium conditions for a pseudo-fluid composed of 65 percent propane, 25 percent propylene and 10 percent n-butane by mole weight. These conditions are to be determined at temperatures of 450, 460, 470, 480 and 490 degrees Rankin.

Since vapor-liquid equilibrium is desired, the main program VLEQUIL must be used. With VLEQUIL, it is also necessary to use all seven functions and the three subroutines SECANT, FITY and FITD. Since a mixture is desired, block data subroutines must be chosen to initialize the common block COEFF, COEFF1, COEFF2, COEFF3, HREF, SREF and CPREF. (If a single component substance were being used, COEFF1 through COEFF3 would not be needed). Therefore the block data subroutines MIXCOEFF, MIXCOEFF1, MIXCOEFF2, MIXCOEFF3, MIXHREF, MIXSREF and MIXCPREF are needed to describe the mixture.

Now that the necessary components of TAPPAM are determined, the proper input to VLEQUIL must be constructed. Card one contains the number of components of the mixture, three. We have five equi-spaced temperatures, therefore card two, the desired number of data points, contains a five. Card three contains the first temperature and the temperature increment. The temperature is 450 degrees Rankin and the increment is 10 degrees Rankin. Card four contains an estimate of the equilibrium pressure at the first temperature. Arbitrarily, select 25 psia for this value. The fifth, and last, card contains the data needed to solve the equation of state for vapor-liquid equilibrium. The first value is the error bound on pressure. A value of 10^{-5} has been found sufficient for this parameter. The next value is the density error bound. The equation of state for pressure is very density sensitive in regions of liquid behavior, so a small value is required. A value of 10^{-10} has been used previously with good results. The next three values are the iteration parameters. Each has been given a value of 1000. The last two values are the bounds on density. The first is the maximum density which will be considered.

For proper selection of this value, known thermodynamic data should be consulted whenever possible. A value of 1.2 lbmole/ft³ is selected here. If a value used does not give convergence, the value should be increased until a solution is found. The last parameter is the minimum density to be expected. A value of zero would suffice, but in order to avoid computational problems, a small positive value is suggested. Here the value is .0001 lbmole/ft³.

The basic data necessary to the program is now complete, and the proper subroutines and functions have been selected. The program must now be run on a computer. The following runstream was used on the UNIVAC 1108 at the University of Maryland to implement the program with the desired data:

B. Use of the Program "ISENTROP"

The problem to be solved is the construction of thermodynamic data for propane along an isentropic line from 50 psia and 600 degrees Rankin. Since we must use ISENTROP, the following subroutines and functions must be used; FITY, SECANT, FP, FH, and FS. The common blocks needed are to be filled with propane data so PROPCOEFF, PROPHREF and PROPSREF are also necessary.

The input data must now be chosen. Card number one must contain the initial state, 50 psia and 600 degrees Rankin. Card number two contains the data for solution to the equation of state. Choosing 10^{-10} for EPS, and 1000 for both KNSRCH and NUMBIT, leaves open the choice of XINT and XFIN. From a vapor-liquid equilibrium table for propane, we see that the saturation pressure for 600 degrees Rankin is 308 psia. Therefore the initial state is superheated vapor and XINT should be less than XFIN. Choose XINT as .0001 and XFIN as 1.2.

The desired temperatures along the isentropic line must now be input. For this example use 599, 598, 597, 596 and 595 degrees Rankin,

Using the above values, the following runstream was created and run on the University of Maryland UNIVAC 1108 Computer:

```

C. Use of the Program "COMPLIQ"

Consider the following problem; it is desired to know the thermodynamic properties of propane at the pressures 300 and 400 psia at 460 degrees Rankin.

Since these conditions are compressed liquid (determined from a vapor-liquid equilibrium chart of propane), the program COMPLIQ must be used. With COMPLIQ, it is also necessary to use FITY, FITD, SECANT, and all functions excluding FF. Also, since propane is the desired fluid, PROPCOEFF, PROPHREF, PROPSREF and PROPCPREF must be used.

The proper input to COMPLIQ must now be determined. Since the points of interest are compressed liquid, XFIN must be less than XINT. Therefore choose XINT as 1.2 and XFIN as .0001. The next cards are the desired pressures and temperatures.

The following runstream was used on the University of Maryland Univac 1108 :

```
@HDG,X          SAMPLE RUN OF COMPLIQ
@COPY,S T.COMPLIQ,COMPLIQ      • COPY COMPLIQ INTO WORKSPACE

D. Use of the Program "COEFFICTS"

Assume a block data subroutine for the reference enthalpy of propane is to be created. Then the program COEFFICTS must be used. Along with COEFFICTS, FITY and ORTHLS are necessary.

Since propane is desired, only one component is necessary. Therefore NUMB is one, and the mole fraction of the major component is also one. The name for the final common block should be HREF, in accordance with the format of the other programs in TAPPAM. From API project 44 (ref. 5), twenty seven reference points for enthalpy were found. Therefore, set N1 to twenty seven, K1 to nine (standard) and J1 to zero (standard). The enthalpy reference values follow. The absolute reference value for propane enthalpy is -35042.07 BTU/lbmole.

With the above data, the following runstream was used on the UNIVAC 1108 at the University of Maryland:

```
