National Rail Plan
MOVING FORWARD
A PROGRESS REPORT | SEPTEMBER 2010
Dear Members of Congress:

I am pleased to submit the enclosed Progress Report, another important step toward advancing a new plan for U.S. passenger and freight rail. This report reflects 15 months of study, consultations with States and freight rail partners, conversations with focus groups of transportation experts, and public outreach events held with communities across America. It reaffirms the commitment of the Congress and President Obama to build a nation-wide high-speed and intercity passenger rail system while preserving the Nation’s premier freight rail network.

A half-century ago, President Eisenhower signed legislation implementing another bold and ambitious idea: the interstate highway system. He envisioned it as a vast system of inter-connected roadways crisscrossing the nation, and for decades our interstates have moved agricultural and industrial goods to market and connected millions of people to affordable homes and quality jobs.

Today, the Administration is working to achieve a vision of similar scope and scale. With America’s rail system, as with the interstates during the 1950s, we haven’t yet drawn all the lines on the map, nor solved all the financing mechanisms. But we are on track to creating a modern, high-speed and interconnected rail system that will support sustained economic growth, move people and goods with greater speed and efficiency, relieve growing congestion, and provide another choice for the public’s mobility needs. This report expands and elaborates on what we have learned so far and illuminates the path ahead.

I look forward to working with Congress on a long-term plan that re-imagines and renews America’s transportation infrastructure – railroads foremost among it – for a new generation of possibility. Thank you for your continued leadership and partnership in this exciting and important effort.

Sincerely yours,

Ray LaHood
INTRODUCTION

The United States and world economies are experiencing an increased demand for rail. Expanding U.S. passenger and freight mobility will require a networked railroad system that is able to modernize and increase capacity. With an estimated U.S. population growth of 70 million people over the next 25 years, mostly centered in metropolitan regions, a national rail plan is needed to ensure a coordinated and intelligent system that provides safe, reliable, and efficient passenger and freight rail service.

At pivotal times in our country’s history, the United States has faced similar challenges and opportunities. Consider: In the mid-1800s, President Abraham Lincoln made possible the first transcontinental railroad to accommodate the inexorable westward movement of people and goods. Nearly a century later, President Dwight Eisenhower launched construction of the interstate highway system to take advantage of a sweeping restructuring of the American economy, transport a booming population, and maximize the use of a technological innovation widely affordable after the war: the automobile.

The United States now faces new challenges spurred by unprecedented population growth, economic transformations, and technological innovations. High-speed rail, now established in many developed nations, is positioned to benefit the United States as the States’ plans mature and projects are implemented. With FY 2009 kick starting U.S. high-speed rail investment and planning, follow-on funding and strategic investment will bring us closer to realizing the vision outlined by Congress and the Administration.

The next American transformation will require an interconnected and balanced transportation network that maximizes the benefits of every mode. A key to integrating these systems is higher-performing rail, including the full spectrum of high-speed and intercity passenger rail, commuter rail, and freight rail. These interconnected rail systems will relieve congestion, promote livable communities, facilitate economic expansion, respect environmental sustainability and provide choices for the American public. This investment will set the stage for job creation, sustainable economic competitiveness, a more resilient infrastructure and a lasting prosperity.

EXPLANATION OF PROGRESS REPORT

This Progress Report details the interplay of factors that demonstrate the importance of efficient and effective rail infrastructure to the Nation’s economy. These include a dramatic increase in population, particularly in high-growth areas, and the concomitant need for transporting more freight and improving safety. Such an infrastructure will also reduce fuel consumption, which, in turn, will enhance our national security by diminishing our reliance on foreign oil.

This report will then describe the different yet complementary visions for the two rail systems, a high-speed and intercity passenger rail system and a high-performing freight rail system. These systems will use many
of the same resources and much of the same infrastructure. Working in tandem, they will connect people and goods in a seamless and efficient manner.

Finally, the report will describe the Federal Railroad Administration’s (FRA) outreach program to develop the National Rail Plan, and its synergy with the U.S. Department of Transportation’s (DOT) Strategic Goals.

MORE PEOPLE, MORE FREIGHT, MORE CHALLENGES

By examining trends and comparing the social, economic and environmental costs of the various modes of transportation, the options for moving people and freight can be weighed. When comparisons are made, rail emerges as one of the safest and most fuel-efficient transportation modes, which positions it to make a significant contribution to improving America’s transportation system. U.S. Census Bureau data project dramatic population growth which will drive increased passenger mobility needs and lead to a corresponding increase in the movement of goods. The FRA’s analysis has shown that on average, Americans require the freight system to move 40 tons of freight per person annually. This includes bulk commodities such as coal for power, grains for food, and high-value consumer goods. These demographic realities mean:

Next 25 years ➤70 Million more people ➤2.8 Billion more tons of freight

Next 40 years ➤100 Million more people ➤4 Billion more tons of freight
PROJECTED POPULATION GROWTH AND THE CHALLENGES IT POSES

If current trends persist, as the population of the United States continues to grow in the decades ahead, urbanized areas will increasingly converge into larger networks of metropolitan areas termed megaregions. There is considerable research on what constitutes a megaregion and Map 1 depicts areas commonly included in megaregion literature. It is forecast that by 2050, 75 percent of the Nation’s inhabitants will live in these areas and 80 percent of population growth will occur there.¹

These megaregions possess dynamic social, economic, and geographic characteristics that are not defined by political or jurisdictional boundaries, rather by concentrated populations and economic activity. Many of the goods consumed by these densely populated areas will be supplied by the surrounding rural regions and nearby ports. Traffic congestion and lost productivity as well as their related effects will continue to diminish the quality of life in and around these megaregions. The Texas Transportation Institute estimated that the cost of congestion in 2007 alone was $87.2 billion and 2.8 billion gallons of gasoline were wasted in 439 urban areas.² The continued growth of these megaregions will impose even more stress on their transportation systems.

Map 1: Emerging Megaregions
Source: Regional Plan Association

¹Dewar, Margaret and David Epstein. Planning for “Megaregions” in the United States. Journal of Planning Literature 2007, number 22, pages 108-123. While existing data and studies indicate the existence of megaregions, the definition of megaregion is still being debated. See also FHWA, “Megaregions: Literature Review of the Implications for Infrastructure Investment and Transportation Planning, 2007”
These demographic trends are unavoidable, and their effect on our current transportation infrastructure will pose enormous challenges. If the Nation is to compete in a global marketplace, more effective investments in transportation infrastructure must be made, and new options considered. More specifically, our transportation network must be rebalanced, and legacy funding and governance models must be modified and improved to accommodate more people and freight.

### NEED FOR MORE CAPACITY

America’s population and freight volume are directly related as illustrated in Table 1. Beginning in 2015, America’s transportation system will move 13 billion tons of freight. By 2035, it will move 15.3 billion tons. And by 2050, it will move 16.9 billion tons. Between 2010 and 2035, the transportation system will experience a 22 percent increase in the total amount of tonnage it moves. When looking forward to 2050, the increase is 35 percent, based upon a total population estimate of 420 million. In addition to the economic benefits of investment in passenger and freight rail, significant public benefits, including reduced fuel consumption and improved safety, also will be realized.

SAFETY

The FRA’s highest priority continues to be the safety of the Nation’s railroads, its users, and its employees. Modern railroads have a safety record that few heavy industries can match. The steady increase in safety has occurred with FRA, the rail industry, rail labor, and many others working in tandem in public-private partnerships toward the same goal. The promising safety trends over the past several decades are all the more impressive given that they occurred during an era of ever-increasing train-miles. Building on the system’s impressive record of safety, FRA issued a High-speed Passenger Rail Safety Strategy in November 2009 and will continue to develop standards and guidelines to support this transformational initiative.

Figures 1 and 2 present a fatality comparison between modes.

Figure 1: Fatalities (per billion ton-miles) in 2008
Figure 2: Total Passenger Fatalities in 2008

The Department’s Federal Motor Carrier Safety Administration monitors heavy truck safety in terms of fatalities per 100 million miles traveled. In 2008, the heavy truck fatality rate was 0.143 fatalities per 100 million miles traveled.

Figure 3: Source and Use of Petroleum
Source: U.S. Department of Energy, Energy Information Administration

SOURCE AND USE OF PETROLEUM

The consumption of petroleum is a growing national concern. Not only is the increasing cost an economic drain, the global competition for petroleum supplies raises profound national security concerns. The charts in Figure 3 illustrate that the United States imports 57 percent of its oil each year, while 71
percent of all petroleum is refined into transportation fuel (jet fuel, gasoline, and diesel fuel). Equally important, a global consensus is emerging about the generation of greenhouse gases (GHG) and their effect on climate change. When petroleum is consumed in transportation, GHGs are released into the atmosphere. While other forms of non-transportation-related diesel emissions may be mitigated, there is a more direct correlation between diesel fuel consumed in transport and GHG emissions. More efficient methods of transportation, therefore, will reduce GHG and other harmful emissions.

Figures 4 and 5 present an energy comparison between modes.

**Figure 4: Ton Miles per Gallon**

![Figure 4: Ton Miles per Gallon](image)

**Figure 5: BTUs per Passenger Miles**

![Figure 5: BTUs per Passenger Miles](image)

Notes: These are aggregate data. Further research is needed for a complete comparison of fuel efficiencies for passenger transportation. Rail and truck efficiency is based on FRA’s 2009 Study of Comparative Evaluation of Rail and Truck Fuel Efficiency on Competitive Corridors. Fuel efficiency is based on doublestack rail moves and comparable truck moves. For water, see Texas Transportation Institute, Center for Ports and Waterways, A Modal Comparison of Domestic Freight Transportation Effects on the General Public, prepared for USDOT, Maritime Administration and National Waterways Foundation, (December 2007), p.42.

**RAIL’S POTENTIAL**

An infrastructure program that significantly improves and balances America’s transportation network will take decades of sustained commitment. Figures 6 and 7 show a comparison between the United States and the rest of the world in the passenger and freight rail markets. The charts indicate that while the US leads the world in freight rail tonnage, the Nation has limited passenger rail service, reflecting the historical emphasis on highway and aviation investment. Many nations are trying to improve the balance between passenger rail and freight rail, just as we are trying to improve passenger rail choices and create additional freight rail opportunities. We cannot afford to fall further behind in our transportation needs.

Rail passengers and freight often travel between locations on the same corridors. Many regions have pursued commuter rail as a low-cost way to improve transportation capacity, from suburban and exurban areas to central business districts using existing railroad corridors. The primary issue facing all three systems (intercity, commuter, and freight) is that limited capacity in existing corridors makes maintaining both reliability and safety a challenge. A high-performance freight system will require modernized corridors that have the
capacity to allow both passenger and freight trains to operate without interfering with each other. Delays to passengers or freight cannot be tolerated if rail is to be relied upon to deliver competitive services to its passengers and freight customers alike. Time-sensitive rail freight, exemplified by growing high-value intermodal traffic, requires investment in upgraded tracks, reduced curvature, improved signal and control systems, and operating capabilities to facilitate the expeditious movement of freight. A high-performing freight system will share characteristics and resources with its higher-speed passenger counterpart, and finding investments that benefit both types of service creates opportunities to optimize the entire rail network.

VISION FOR HIGH-SPEED INTERCITY PASSENGER RAIL

Goal: Connect communities with High-speed and Intercity Passenger Rail where population densities and competitive trip times create markets for success.

Transportation solutions have always responded to the unique economic, social, and technological contexts of their time, and our era requires the same bold spirit that impelled previous innovations.

This Progress Report is another step in further refining the President’s vision for improving high-speed passenger rail service in the United States. When submitted, the National Rail Plan will offer more detail with strategies and recommendations to accomplish the vision.

Success will require a long-term commitment to passenger rail at the Federal, State, and local levels, similar to the dedication shown to the interstate highway network in the latter half of the 20th century. It will also require the participation of a number of private entities, from equipment manufacturers to service operators. We believe that it is an achievable and realistic vision, and one that responds to the new era of challenges and opportunities confronting the United States.
OVERVIEW

FRA’s vision for a national high-speed rail program is to develop tiered passenger rail corridors that take into account the different markets and geographic contexts found throughout the United States. This approach builds on the legislative framework established in the Passenger Rail Investment and Improvement Act of 2008 (PRIIA) and $8 billion provided in the American Recovery and Reinvestment Act of 2009.

This vision includes the following tiers:

• **Core Express Corridors**: These routes would connect large urban areas up to 500 miles apart with 2-3 hour travel time and train speeds would be between 125 and 250 mph. Service will be frequent and will operate on electrified, dedicated track that is publicly owned. Based on their operation in and between large, dense metropolitan regions, the Core Express corridors will form the “backbone” of the national passenger rail system.

• **Regional Corridors**: This network would connect mid-sized urban areas, and smaller communities in between, with convenient, frequent 90-125 mph service on a mix of dedicated and shared track, depending on the particular corridor. In some areas, these corridors could connect to Core Express corridors, with many potential passenger services operating over both the Core Express and Regional routes.

• **Emerging/Feeder Routes**: Emerging routes would connect regional urban areas at speeds up to 90 mph on shared track. In some areas, the Emerging/Feeder routes could connect to the Core Express or Regional corridors, allowing residents of these smaller or more distant areas to have efficient access to the national system.

• **Community Connections**: For this vision of 21st century passenger rail to be successful, it must be integrated with existing and future policies and investments in public transportation, airports, and other modes to provide convenient options for accessing the passenger rail network. This access is critical to ensuring that passenger rail is a viable alternative to other methods of intercity travel.

The U.S. Department of Transportation is developing criteria to identify regions of the country where Core Express, Regional, and Emerging/Feeder corridors could be feasible. This criteria will include variables such as estimated trip times, highway and airport congestion, ridership estimates, distance, and other key cost and benefit measures. In part, the goal of this criteria will be to ascertain how high-speed passenger rail can serve the increasing mobility needs between megaregions.
Costs and Benefits
The total capital investment needed to develop the future high-speed and intercity passenger rail network is significant, like other major infrastructure programs and projects. Investment must include all costs associated with developing the system, including planning and engineering, right-of-way acquisition, and the construction of track, stations, and other facilities and equipment.

While passenger rail systems are capital intensive, the benefits are expected to be significant. In addition to addressing major transportation challenges such as population growth, energy consumption, environmental protection, and congestion, this passenger rail vision will also:

- Balance the transportation network and provide complementary service between modes. In some cities, there is simply no room to expand airports or highways, regardless of whether financing is available to accomplish these projects. A high-speed and intercity passenger rail network will complement existing transportation choices and, in many cases, relieve some of the increased demand.

A recent analysis by the U.S. Conference of Mayors showed that the introduction of high-speed rail service could have a substantial impact on how people make intercity trips. The report examined four potential high-speed rail hubs (Los Angeles, Albany, Orlando, and Chicago) and found that high-speed rail could reduce intercity car trips to these cities by 27 percent on average, and eliminate the need for 900,000 annual short-haul flights—just to these four hubs. The resulting congestion decreases for both air and highways will result in significant and measurable savings that accrue to the local economies in which they occur.

Table 2 illustrates the comparative advantage of different modes based on market factors.

• Reduce congestion in America’s megaregions. In Map 2, megaregions are illustrated along with the top 10 most congested airports and the top 10 cities with the most congested roads. High speed rail could be particularly beneficial in these areas. As the Brookings Institution recently found, “continued growth in short haul air travel (500 miles or less) presents logistical, economic, and environmental challenges.”\(^4\) In the urban areas depicted in Map 2, the average annual delay per traveler is over 53 hours, which equates to more than 6 days (per year) lost due to congestion.\(^5\)

---

\(^4\) Metropolitan Policy Program at Brookings, Metropolitan Infrastructure Initiative Series, October 2009.

\(^5\) Texas Transportation Institute, Urban Mobility Report 2009.
• Boost manufacturing and economic activity. According to a report by the Center on Globalization, Governance and Competitiveness, the U.S. rail market is the most open market in the world.\(^6\) A commitment to developing a 21st century long-term passenger rail network will provide a significant boost to the manufacturing sector, creating green, high-wage jobs for thousands of people. Additionally, well over a million people could be employed in constructing the network, and thousands more in operations and maintenance.

Beyond these direct economic effects, high-speed rail could also have a significant influence on the nature of many regional economies. These benefits will come from: (1) added economic output; (2) earnings associated with new jobs; and (3) efficiency gains (including land use efficiencies). Los Angeles County estimates that the total financial payback of California's high-speed rail network, over the life of the system, will account for 2-4 percent of its annual gross regional product.\(^7\) Indeed, the annual benefits for Los Angeles alone are expected to be greater than the total value of State bonds that will be used to initiate California's entire high-speed rail network.

• Maximize the identified HSR corridors and stations as centers for new or revitalized economic and community development. In particular, passenger related rail Infrastructure investments must be accompanied by strategic and bold companion plans for housing, employment and services in proximity to this infrastructure, in order to ensure maximum use of the system, and reap the full benefits of environmental sustainability and energy conservation.

The FRA is continuing to evaluate and develop cost/benefit analyses and will include updated information in the final plan.

HIGH PERFORMANCE FREIGHT RAIL

Goal: Support the current freight rail market share and growth.
Goal: Develop strategies to attract 50 percent of all shipments 500 miles or greater to intermodal rail.

The U.S. economy depends on freight transportation to link businesses with consumers, suppliers, and markets across the Nation and around the world. Freight transportation connects population centers, economic activity, production, and consumption. The national transportation system’s capacity to make these connections and perform these services is essential to American businesses, households, and communities. Moreover, the performance and costs of our freight transportation systems are important ingredients in the comparative advantage of the United States when competing with other economies. Although speed and reliability are important measures of our freight system’s performance, other measures, such as safety, security, fuel efficiency, and external costs such as GHG emissions, are also important public concerns.

Rail is efficient at moving heavy freight over long distances, as are water and pipeline freight services. Trucks excel in providing time-sensitive delivery services for high-value goods being transported over medium- and short-haul distances. Raw materials and heavy freight going long distances are likely to continue their journey by rail, or some combination of truck, rail, and water. With the future growth in freight, it is anticipated that freight rail will continue to make investments in the capacity required to move heavy and long-distance shipments.

HOW FREIGHT MOVES

Rail is used by shippers to transport many types of commodities comparatively shorter distances as well, but profits are often more easily realized by railroads on long-haul shipments. Rail has the largest share of freight on a ton-mile basis, handling nearly 40 percent of ton-miles in the United States. The mode share by tons and by ton-miles is shown in Figure 8.

Figure 8: Freight Transportation Mode Share
Source: Commodity Flow Survey
The Staggers Rail Act of 1980 partially deregulated the freight rail industry which led to dramatic productivity gains and improved efficiency in the freight rail network. The railroads focused on making their operations more efficient by shedding non-profitable lines to regional and short-line railroads, removing antiquated track and facilities, and fostering labor productivity gains. These efficiency gains resulted in reduced prices as shown in Figure 9. For the first 15 years of this period, the railroad industry reduced costs by over $17 billion. Railroads have passed on to shippers approximately 80 percent of that cost savings. After this initial period, however, these productivity improvements were slower because the easy efficiencies were already implemented.

Compared with other major industries, today's freight railroads invest one of the highest percentages of revenues to maintain and add capacity to their system. The majority of this investment is for maintenance to ensure the state of good repair with approximately 15-20 percent of capital expenditures, on average, used to enhance capacity. The capacity enhancements made during the recent economic downturn has positioned the railroads to meet the short-term, but not long-term capacity concerns. Key investments will be needed to meet future growth in freight demand.

The performance of the freight system can be greatly improved by enhancing the connections between individual modes of transportation in order to make the best use of the inherent efficiencies of each mode.

---

The growth in freight in future years is an estimate; however, there is no doubt that freight demands will increase and the need to safely and efficiently move freight will grow significantly.

Based on freight projections and using the current market share, in 2035 trucks would carry an additional 2.1 billion tons. This equates to 131.3 million more truck trips each year representing an increase of 20 billion more truck vehicle miles travelled and 315 billion more ton-miles. Freight rail would carry an additional 450 million tons. This represents a 23 percent increase in tonnage from 2007 levels.

**ROLES OF OTHER MODES**

All modes have their own strengths and, therefore, have an important place in the transportation marketplace. Figure 10 illustrates the effect of distance on the relative share of freight in billions of ton-miles between water, truck, and rail.
**Pipelines:** Pipelines are a unique mode of transport in that they can carry a relatively limited type of commodity to a limited number of destinations. Pipelines safely and efficiently move about 19.6 percent of total freight ton-miles.\(^9\)

**Airfreight:** Airfreight is fast, but very fuel-intensive. Most freight can be flown, but size and weight greatly influence cost. Airfreight is a specialized transportation function used when industry depends on receiving an item that they cannot wait for, or when consumers choose to ship by air because they desire a product quickly. Airfreight accounts for just 0.3 percent of all freight ton-miles.\(^10\)

**Waterways:** Shipping by water is a safe and energy-efficient method of freight transportation. Waterborne freight has little contact with the public, whether moving along coastal routes or on inland waterways. Although river transportation has long been associated with slow shipments of bulk freight, recent governmental activities have aided the development of the Marine Highway System to offer transportation services to move intermodal freight along coastal corridors.

**Trucking:** Probably the most visible form of freight transportation is provided by the trucking industry. Trucking provides a vital service in and of itself, but it is also a key link as the beginning or ending stages of loads that are transported by other modes. When the transportation services of air, barge, rail, and pipeline do not deliver to the door of the final customer, it is the trucking industry that performs this service. When compared to other forms of surface transportation, moving freight by truck is the most fuel-intensive mode. On a ton-mile basis, trucks handle about 28.6 percent of the freight transportation market share.\(^11\)

Table 3 illustrates the potential advantage of different modes with respect to weight and distance. The various modes of transport are ranked in each of the cells by the comparative efficiency of each.

IMPROVED CORRIDORS AND CONNECTIONS WILL ENHANCE NATIONAL ECONOMIC COMPETITIVENESS

The rail system is part of a transportation network in which shippers choose the most cost-effective mode for moving goods. This may be a single mode for door-to-door service or a combination of modes where the goods move by rail for the long-haul and by truck at the origin, destination, or both. Generally, rail competes favorably with trucks at hauls beginning at around 500 to 700 miles, but has more success in the longer haul markets.

Freight carried by both truck and rail travels over a series of prime corridors that cross the Nation. These corridors are depicted in Map 3.

Each of these corridors handles a large percentage of the Nation’s freight and represents a lifeline of domestic economic activity. Many of the railroads’ large intermodal efforts are focused on traffic to and from ports for international trade and therefore directly affect the Nation’s ability to compete globally. Traffic in these high-density corridors will continue to grow, and with that growth, the railways, ports, and highways will be even more over-burdened in the future. Improving freight rail’s intermodal market share and connections to ports supports the President’s National Export Initiative by enhancing the private sector’s ability to export.

Map 3: Major Freight Corridors
THE GROWTH IN INTERMODAL FREIGHT WILL BE ON ALL SURFACE MODES

The intermodal market has been the fastest growing segment of the freight rail industry since 1980, as shown in Figure 11. The combination of population growth and the growth of the intermodal movement of goods will continue to drive this trend in the future. The growth of intermodal shipments has occurred primarily in the longer distance corridors (over 700 miles). With improvements in service and facilities, rail intermodal can be competitive in shorter distances, thereby absorbing some of the projected growth in freight.

Figure 11: Intermodal Growth for Eastern and Western Carriers (1990-2008)
(Data for early years are combined to reflect merged carriers)
One example of the dramatic benefits of shifting to rail intermodal is illustrated by the fact that just one long-distance, double-stack train between Chicago and Los Angeles can save 75,000 gallons of fuel by replacing 300 trucks, each traveling 1,983 miles.\textsuperscript{12} If rail were to move 50 percent of the 500-mile and greater market by 2035, it will need to carry nearly 18.2 million containers more than its current market share (see Figure 12).

**Figure 12: Modal Shift Projection**

Map 4 overlays the top intermodal corridors listed in Table 4 with projected megaregions in order to show the top ten state-to-state bi-directional intermodal flows. Railroads have invested in the markets where there is a sufficient return on investment—the longer-haul markets. For example, the shorter-haul markets in the eastern third of the United States represent a region in need of additional intermodal service and investment.

**Map 4: Top Intermodal Corridors**

*This map depicts linkages between megaregions to show intermodal rail movement, not the actual routes.*

The FRA is continuing to analyze data and recommendations for growing the freight intermodal market to support DOT’s strategic goals.

OUTREACH PROCESS

Understanding rail’s role in meeting freight and passenger demands has been the subject of an extensive outreach process in different forums that have provided information that was crucial to preparing this Progress Report and ensuring the quality of the final plan.

President Obama outlined his vision for high-speed rail in America, and in April 2009 the FRA published the Vision for High-Speed Rail in America. The FRA submitted the Preliminary National Rail Plan to Congress on October 14, 2009. On October 15, FRA began developing the National Rail Plan. While these may seem like separate events, they constituted a continuous and collaborative process over the last 15 months that served to inform and educate FRA and our diverse stakeholders about the challenges, immense potential, and renewed commitment to rail in America.

- April 16, 2009 — Vision for High-speed Rail in America released
- May/June 2009 — High-speed Intercity Passenger Rail (HSIPR) regional outreach meetings
- October 15, 2009 — Preliminary National Rail Plan released
- March/April 2010 — National Rail Plan focus groups
- May/June 2010 - National Rail Plan regional outreach meetings
During this time, FRA led 12 public outreach events throughout the Nation and 10 focus groups to develop a complete and detailed understanding of the issues facing us as we develop a strategy to leverage the inherent strengths and public benefits of freight and passenger rail to support DOT and national goals.

The map below shows the cities where FRA conducted public outreach sessions.
Hundreds of respected subject matter experts participated in the focus groups. These experts represented a diverse collection of professionals who participated in an open and collaborative process to identify the issues and challenges that the National Rail Plan should address and to recommend strategies to resolve them. Figure 13 illustrates the diverse affiliations of people who participated in focus groups.

Figure 13: Focus Group Participants

During FRA’s outreach meetings, the following common themes emerged:

- This is a unique period. We must collaborate to advance both passenger and freight rail.
- Federal leadership is needed to set transportation priorities to rebalance the transportation network and benefit the public.
- High-speed rail needs to supplement air travel in 100 to 600 mile distances.
- The freight rail system must not be harmed and the market share of freight rail should grow.
- The FRA should focus on corridors, establish performance measures, and publicize definitive information about public benefits and costs.
- Dedicated and sustained passenger rail funding sources are imperative.
- The National Rail Plan should take advantage of U.S. manufacturing capabilities.

In addition to the face-to-face meetings, FRA’s outreach included numerous regularly scheduled conference calls and webinars with participation by senior government leaders. A proactive presence at industry meetings and events by senior leaders also provided a way for FRA to inform and receive feedback from stakeholders. Some of the key organizations who have supported this effort include Amtrak, American Association of State Highway and Transportation Officials (AASHTO), Association of American Railroads (AAR), American Public Transportation Association (APTA), The OneRail Coalition, The Railway Supply Institute (RSI), National Association of Railroad Passengers (NARP), Regional Plan Association, environmental associations and groups ranging from labor leadership to railroad CEOs.

The FRA Web site has been used to post presentations and other outreach information that was available for download. A Federal docket was available for anyone to post comments and offer their contribution to the National Rail Plan.
STRATEGIC GOALS AND OUTCOMES

A strong rail component can complement our national transportation system, giving us additional choices for the movement of people and goods. The prosperity of the 20th century was built, in part, on the rail investments of the 19th century. Similarly, the 20th century investments in our interstate highways, waterways, and aviation facilities have enabled us to produce unprecedented wealth and to compete globally. Building infrastructure that will enable a more prominent rail component will ensure that our transportation system will be better able to meet the challenges of a growing population, increasing energy and environmental concerns, and a highly competitive global economy.

The U.S. DOT Strategic Plan FY 2010-FY 2015: Transportation for a New Generation offers transformation in U.S. transportation policy. The goals of this plan are to increase accountability and maximize the public’s investment in a new, multimodal, performance-based environment. This section summarizes the Department’s strategic goals and rail’s ability to meet the stated challenges through its inherent advantages. The Department’s strategic goals are:

- Safety
- State of Good Repair
- Economic Competitiveness
- Livable Communities
- Environmental Sustainability

With an emphasis on performance-based, multimodal investments, DOT’s strategic goals promote the implementation of the best transportation choices. It is expected that the railroad industry’s ability to offer solutions to each of DOT’s five strategic goals will result in a larger role for rail in the U.S. transportation mix. The strategic goals, desired outcomes, and the ability of FRA and the rail industry to achieve them are described below.

Safety

Secretary LaHood has reinforced U.S. DOT’s dedication to safety and has identified and addressed new concerns such as “distracted driving.” Improving public health and safety by reducing transportation-related fatalities and injuries is DOT’s top priority, and transportation safety has made steady gains over the years. The FRA is also dedicated to improving railroad safety by developing and enforcing safety regulations, along with research and development of railroad safety technologies. Railroad safety has improved steadily over time and rail often has a safety advantage compared with other modes for both passenger and freight transportation. With this safety advantage, increasing the market share of both passenger and freight rail provides a measurable public benefit in reduced fatalities and injuries. It will also enhance the security and resilience of transportation.

The “High-speed Passenger Rail Safety Strategy,” published by FRA in November 2009, was the result of extensive outreach and collaboration between FRA and the Rail Safety Advisory Committee. This strategy will:

- Support a very high level of safety for new passenger rail service;
- Focus on safety results and flexibility to meet service needs while achieving those results; and,
- Ensure alignment between safety requirements and passenger rail funding policies.

**State of Good Repair**
The United States has the world’s most extensive and productive transportation system, representing trillions of dollars of public and private investment. It is vital to the Nation’s economic competitiveness that this critical infrastructure be actively maintained. Transportation infrastructure requires some level of public investment to ensure that the public benefits from a safe, secure, and reliable system. Railroad owners invest billions of dollars each year in funds generated from revenues and private capital markets to maintain and improve their bridges, tunnels, tracks, signals, dispatching centers, communication systems, and shops.

**Economic Competitiveness**
Moving the U.S. workforce and its products in a quick and productive manner increases economic competitiveness. Traffic congestion wastes time, money, and petroleum. Freight rail can ease congestion by moving freight off highways, while commuter trains will give commuters a non-highway option. Rail can be an attractive choice, particularly for intermodal trips over 500 miles. For the 100 to 600 mile trip between city centers, passenger rail travel, without lost time at airports for security checks and queuing in gate areas, can provide a competitive option that offers business travelers minimum loss of productive time when travelling between city centers. Moreover, as stated earlier, significant investment in a high-performing rail network will have far-reaching job-creation and economic benefits that improves America’s manufacturing base.

**Livable Communities**
A focus on livable communities—places where transportation, housing, and commercial development investments have been coordinated so that people have access to adequate, affordable, and environmentally sustainable travel options—represents a transformational policy shift for DOT. Having direct connections between intercity and high-speed passenger rail, commuter rail, and local transit options changes how users of the transportation network move and live.

In many communities, rail service can be the center of economic revitalization efforts. Passenger rail can prompt both the physical and the economic rebuilding of city centers. Increased foot traffic around stations has revitalized city centers and encouraged commercial and residential growth as businesses move in to serve commuters and other passengers. Local roadway congestion is reduced as passengers and freight move through the area by rail instead of the roads.
Grade-crossing safety improvements or grade separation, in combination with quiet zones, can also raise the quality of life in urban areas.

**Environmental Sustainability**

The DOT is committed to advancing environmentally sustainable policies and investments that reduce carbon and other harmful emissions from transportation sources while protecting our natural resources and reducing our dependence on foreign oil. The DOT will promote the reduction of carbon-intensive travel on highways and airways and the substitution of more energy efficient transportation systems, including rail, where feasible. With its comparative energy advantage, rail serves a vital role in helping to reduce the need for foreign oil and to increase environmental sustainability.

High-performance freight rail is more fuel efficient than trucks, and state-of-the-art, high-speed passenger rail can provide an environmentally friendly alternative to air travel. Rail can thus contribute to DOT’s goal of reducing emissions from freight transportation by improving the fuel efficiency of freight vehicles, as well as by reducing transportation’s petroleum consumption.

**CONCLUSION AND NEXT STEPS**

The prosperity of the 20th century was built, in part, on the rail investments of the 19th century. Similarly, the 20th century investments in our interstate highways, waterways, and aviation facilities have enabled us to produce unprecedented wealth and to compete in the global marketplace. When completed, the first-ever National Rail Plan will establish the framework necessary to begin laying a foundation that will improve our transportation network for future generations. The necessary improvements in passenger and freight mobility will lead to economic, environmental, and societal benefits for all Americans.

This transformational vision can only be accomplished by collaboration and partnerships between Federal, State, local, and tribal governments, along with private sector investment. During the past year, FRA has conducted exhaustive research and detailed analysis to develop the recommendations to accomplish this vision. The next steps to complete the National Rail Plan include identifying regions of the country where Core/Express, Regional, and Emerging/Feeder corridors could be feasible for a tiered passenger rail network; estimate investments to develop the passenger rail network and improve freight rail intermodal corridors (with a comparison to other major infrastructure programs); and, the return on investment, including public benefits, from such investments. Finally, there will be a comprehensive strategy to implement the Plan with legislative, policy and administrative recommendations.
