## WAYSIDE RADIO MANUFACTURING TEST REQUIREMENTS SPECIFICATION

Doc: MTRS0000003  
Rev: 4  
Date: Sep 23, 2011

## 1 INTRODUCTION

### 1.1 PURPOSE

The purpose of this document is to establish the manufacturing functional test requirements for the Wayside Radio.

### 1.2 SCOPE

This document defines functional test requirements to be implemented for the Wayside radio. It does not document how the requirements are to be implemented. Such design implementation criteria is defined in a separate document. This document is intended for design engineers, and test development engineers.

**1.3 DEFINITIONS, ACRONYMS, AND ABBREVIATIONS**

<b>Item</b>	<b>Entry</b>	<b>Description</b>
T2.01	MCC	Meteorcomm LLC
T2.02	CA	CalAmp Corp
T2.03	FCT	Functional Circuit Test
T2.04	PCBA	Printed Circuit Board Assembly
T2.05	VDC	Voltage Direct Current
T2.06	VAC	Voltage Alternating Current
T2.07	DUT	Device Under Test
T2.08	NA	Not Applicable
T2.09	Wayside	Wayside Radio
T2.10	ITC	Interoperable Train Control
T2.11	DFS	Degradation from Full Scale
T2.12	ppm	parts per million
T2.13	ND	Not Defined
T2.14	PEP	Peak Envelope Power
T2.15	VSA	Vector Signal Analyzer
T2.16	N/A	Not Applicable
T2.17	TBD	To Be Determined
T2.18	TX	Transmit
T2.19	RX	Receive
T2.20	RSSI	Receive Signal Strength Indicator

Table 2 – Reference Documents

## 1.5 DOCUMENT OVERVIEW

This document describes the manufacturing functional test requirements for the Meteorcomm Wayside Radio. It is divided into sections:

- Section 1 describes the purpose, scope, definition of acronyms and abbreviations, and references documents, and a brief overview of the document.
- Section 2 presents a brief description of the radios
- Section 3 presents the Tx Tuning Procedure
- Section 4 describes the unit level test requirements.

The requirements are tagged with the identifier “TRS##.” As the requirement identifiers are referenced by other documents, the identifiers should NEVER be changed without understanding the work involved in bringing all documents involved to consensus.

The “ITC 220MHz Radio Hardware Specification v1 4.pdf” (ref T3.03) Appendix A & B is the source for all unit level electrical requirements. This document may tighten certain limits in manufacturing to accommodate requirements that have no allowable DFS over unit environmental conditions.

## 2 OVERALL DESCRIPTION

This ITC Radio is used as part of a larger communication system used by the railroad industry. The test strategy for the radios includes a sub level functional test for tuning and also a final level device functional test.

## 3 TEST REQUIREMENTS

### 3.1 DUT TEST SETUP

The Wayside Radio may be tested within a sealed RF enclosure when testing at the unit level. The enclosure provides shielding against other ITC radios or other products that may produce interference within the ITC band. The enclosure is recommended but not required. Other tests may be done without the RF enclosure. If the enclosure is used all instrumentation connections to the DUT shall be made through the enclosures interface panel.

In general the Radio is commanded through it's Maintenance port. A connection is made from a PC to the Maintenance port though Ethernet. ASCII commands, referred to as "CLI Commands" are sent to the radio over telnet. The radio will respond with ASCII over telnet when appropriate.

Power is applied to the radio through the Power Interface Port.

The Unit Level Receive test setup will consist of a modulated signal source that is connected to either the Primary or Diversity RF Port.

The Unit Level Transmit test setup will consist of an RF attenuator and a Vector Signal Analyzer (VSA) (or similar) that is connected to Transmit RF Port. The attenuator shall be a 50 Ohm attenuator with sufficient attenuation (> 40 dB) to protect the VSA from excessive RF levels from the 25W transmitter.

### 3.2 TRANSMITTER TUNING TEST SETUP

The Transmitter Tuning step for the Wayside radio is documented in reference T3.04. This testing is done at a sub-assembly step of radio integration where the operator has access to internal connections. The three radio PWAs are assembled into the radio chassis and the ribbon cable connecting the three PWAs is connected.

The Master Board is commanded through it's Maintenance port. A connection is made from a PC to the Maintenance port though Ethernet. ASCII commands, referred to as "CLI Commands" are sent to the radio over telnet. The radio will respond with ASCII over telnet when appropriate.

Power is applied to the radio connector (+13.6V nominal).

### 3.3 REFERENCE CLOCK TUNING TRS01

Verify that the Signal Analyzer is connected to the Transmit output of the Master Board (J20). Apply 13.6VDC to the Wayside radio and allow it to boot. Execute the commands to enable a CW tone at 220MHz.

Using the VSA spectrum analyzer output measure the frequency of the signal. Tune the XO until the frequency error is within the limit defined below. Save the setting.

Test #	Parameter	Expected (MHz)	Min (MHz)	Max (MHz)
TRS01.1	Frequency	220.000000	219.999965	220.000035

**Table 3 – Reference Clock Tuning TRS01**

### 3.4 RF/DC BOARD BIAS LEVEL CONFIGURATION (OPEN LOOP) TRS02

Verify that the Wayside Tx cable is connected between the Master Board and RF/DC Board. Connect the Radio for TX testing per Section 3.1 Apply 13.6VDC to the Wayside radio and allow it to boot. Per reference T3.04 issue the commands to set the PA Bias and dds level, then enable the transmitter in half rate pi/4 DQPSK mode. Adjust the PA Bias through the CLI commands until the measured value is within the limits of Table 4.

Test #	Parameter	Min	Max
TRS02.1	PA Bias	4.95V	5.05V

Table 4 – PA Bias Level Configuration TRS02

### 3.5 POWER OUTPUT TUNING TRS03

Connect the Radio for TX testing per Section 3.1. Apply 13.6VDC to the Wayside radio and allow it to boot. Load the VSA with the state specified in T3.04 (section 2.2.3.2) and send the CLI commands to set up the dds level, igain and qgain per T3.04 section 2.2.3. Execute the commands to enable the Wayside radio to produce half-rate pi/4 DQPSK Modulation at 221.1375MHz at the specified duty cycle (T3.04 section 2.2.3).

Measure power output and adjust the dds level until the power out reaches the expected level. The current draw is monitored throughout the tuning process. When finished save the calibration using the CLI command interface.

Test #	Parameter	Expected	Min	Max
TRS03.1	Current Draw	NA	NA	10A
TRS03.1	Power Out	25W PEP (44.0dBm)	43.8 dBm	44.2 dBm

Table 5 – Power Output Tuning TRS03

## 4 UNIT LEVEL TEST

### 4.1 WAYSIDE POWER SUPPLY CURRENT DRAW TRS04

The test verifies the Power Supply Current Draw with the DUT after initially powered on, when receiving, when transmitting at maximum power out, and in Power Save Mode. Note that the Power Save Mode is currently undefined for the Wayside Radio.

Test #	DUT Status	Radio Voltage	Min Current (A)	Max Current (A)
TRS04.1	Initial Power On	13.6V	0.4	1.0
TRS04.2	Receiving	13.6V	0.4	1.0
TRS04.3	Max Transmit	13.6V	5	10
TRS04.4	Power Save	13.6V	N/A	N/A

Table 6 – Power Supply Current Draw TRS04

### 4.2 POST TEST TRS05

This test is intended to verify that the radio has passed the internal POST.

With the unit booted up and an open telnet session, execute the CLI POST command and parse the DUT response for Pass/Fail indications. Note that the first time a unit is powered up the POST test for Serial Number verification will fail. This can be ignored as TRS08 programs and verifies the DUT Serial Number.

### 4.3 MAC ADDRESS REPORTING TEST TRS06

This test is intended to record the Ethernet MAC address for each Ethernet Port.

With the unit booted up and an open telnet session, execute the CLI command and to read each Ethernet Port's MAC address. Record the result in the Test Report.

#### 4.4 SW/FW IMAGE VERIFICATION TEST TRS07

This test is intended to verify that the DUT has the correct version of CPLD code, Boot Launcher Code and Application code. It also verifies the DUT has been flashed and properly formatted with the Application load.

With the unit booted up and an open telnet session, execute the CLI commands to verify the version of the CPLD, Boot Launcher and Sprint Application Code. These versions of code are defined at the Top Level BOM – reference T3.01. Then execute the CLI commands to verify the proper formatting of the on-board flash.

The Board Type is also verified at this point, for Sprint 23.02, it should be set to “MB3”.

#### 4.5 SERIAL NUMBER PROGRAMMING & VERIFICATION TEST TRS08

This test writes the DUT serial number to the radio then verifies it has been saved in the DUT.

With the unit booted up and an open telnet session, execute the CLI command to program the DUTs serial number. The serial number is bar coded on the DUT per T3.07. The serial number shall be saved to the unit then recalled to verify it was programmed correctly.

#### 4.6 LED TEST TRS09

With the Radio booted, send the CLI command to enable all LEDs. The operator will verify they are all on.

Send the CLI command to disable all LEDs. The operator will verify they are all off.

## 4.7 RX RSSI Calibration TRS10

This test provides a calibration of the Rx path RSSI. Connect a Signal Generator to the Primary Receiver RF Port and generate an input signal for Full Rate DQPSK at -50 dBm, mid frequency band. Execute the commands to the maintenance port to set the radio up for Primary Receive, this will include the channel, modulation type and frequency. Poll the Wayside's RSSI and adjust the RSSI Calibration parameter until the reading is within the limits of Table 7.

Test #	Port	Supply Voltage	Modulation/ Input Level	Frequency (Mhz)	RSSI MIN (dBm)	RSSI MAX (dBm)
TRS10.1	RX1 (PRI)	13.6V	$\pi/4$ DQPSK  -50 dBm	219.9125	49.9	50.1

**Table 7 – Receiver RSSI Calibration TRS10**

## 4.8 Primary Receiver Sensitivity Tests TRS11

Connect a Signal Generator to the Primary Receiver RF Port and generate the appropriate input signal. Execute the commands to the maintenance port to set the radio up for Primary Receive, this will include the channel, modulation type and frequency. Execute the tests in Table 8 and verify the Bit Error Rate through the appropriate CLI commands. Note: This test should report the BER as well as the RSSI value.

Test #	Port	Supply Voltage	Modulation	Frequency (Mhz)	Input Level (dBm)	Max (BER)
TRS11.1	RX1 (PRI)	<u>Mid Voltage</u>	$\pi/4$ DQPSK (1/2 Rate)	217.7125	-111	1E-4
TRS11.2		13.6V		219.9125	-111	1E-4
TRS11.3				221.8875	-111	1E-4
TRS11.4			$\pi/4$ DQPSK (Full Rate)	217.7125	-108	1E-4
TRS11.5				219.9125	-108	1E-4
TRS11.6				221.8875	-108	1E-4
TRS11.7				217.7125	-7	1E-4
TRS11.8		219.9125		-7	1E-4	
TRS11.9		221.8875		-7	1E-4	

Table 8 – Receiver BER TRS11

## 4.9 Simultaneous Channel Test TRS12

Connect a Signal Generator to the Primary Receiver RF Port and generate the appropriate input signal. Execute the commands to the maintenance port to set the radio up for Primary Receive, this will include the channel, modulation type and frequency. Validate each of the two (2) Base Channels for BER through the appropriate CLI commands. The tests below are performed with the Base radio powered on at the mid voltage level.

Test #	Supply Voltage	Modulation	Frequency (Mhz)	Input Level (dBm)	Max (BER)
TRS12.1	<u>Mid Voltage</u> 13.6V	$\pi/4$ DQPSK (Half Rate)	219.9125	-50	1E-4

Table 9 – Receiver, Simultaneous Channels BER TRS12

#### 4.10 Transmit Output Power Test TRS13

Connect the Radio for TX testing per Section 3.1 Execute the commands to the maintenance port to set the radio up for Transmit, this will include the modulation type, frequency, and output power indicated in the table. For each set of inputs measure the power output and compare to the limits. Validation for low power is intended to make sure the radio meets the minimum power backoff.

Test #	Supply Voltage	Modulation	Power Setting	Frequency (Mhz)	Min (dBm)	Max (dBm)
TRS13.1	<u>Low Voltage</u> 10.9V	$\pi/4$ DQPSK (1/2 Rate)	25W PEP (44.0dBm)	217.6125	41	46
TRS13.2				219.8125		
TRS13.3				221.9875		
TRS13.4			7.5W PEP (38.75dBm)	219.8125	30	40.8
TRS13.5	<u>Mid Voltage</u> 13.6V	$\pi/4$ DQPSK (1/2 Rate)	25W PEP (44.0dBm)	217.6125	43	45
TRS13.6				219.8125		
TRS13.7				221.9875		
TRS13.8			7.5W PEP (38.75dBm)	219.8125	30	39.8
TRS13.9	<u>High Voltage</u> 15.5V	$\pi/4$ DQPSK (1/2 Rate)	25W PEP (44.0dBm)	217.6125	41	46
TRS13.10				219.8125		
TRS13.11				221.9875		
TRS13.12			7.5W PEP (38.75dBm)	219.8125	30	40.8

Table 10 – Transmit Output Power Test TRS13

#### 4.11 Transmit Frequency Accuracy Test TRS14

Connect the Radio for TX testing per Section 3.1 Execute the commands to the maintenance port to set the radio up for Transmit, this will include the modulation type, frequency, and output power indicated in the table. The VSA shall be setup to demodulate the signal and provide the carrier frequency offset. The value will be converted to parts-per-million (ppm) and compared to the limits.

Test #	Supply Voltage (VDC)	Modulation	Power Setting (PEP)	Frequency (Mhz)	Min (ppm)	Max (ppm)
TRS14.1	13.6V	$\pi/4$ DQPSK (1/2 Rate)	25W	217.6125	-0.25	+0.25
				219.8125	-0.25	+0.25
				221.9875	-0.25	+0.25

**Table 11 – Transmit Frequency Accuracy Test TRS14**

## 4.12 Transmit Error Vector Modulation Test TRS15

Connect the Radio for TX testing per Section 3.1 Execute the commands to the maintenance port to set the radio up for Transmit, this will include the modulation type, frequency, and output power indicated in the table. The VSA shall be setup to demodulate the signal and provide the EVM. The value shall be compared to the limits.

Test #	Supply Voltage	Modulation	Power Setting	Frequency (Mhz)	Max
TRS11.1	<u>Low Voltage</u> 10.9V	$\pi/4$ DQPSK (1/2 Rate)	25W PEP (44.0dBm)	217.6125	5% RMS
TRS15.2				219.8125	
TRS15.3				221.9875	
TRS15.4			7.5W PEP (38.75dBm)	219.8125	
TRS15.5	<u>Mid Voltage</u> 13.6V	$\pi/4$ DQPSK (1/2 Rate)	25W PEP (44.0dBm)	217.6125	5% RMS
TRS15.6				219.8125	
TRS15.7				221.9875	
TRS15.8			7.5W PEP (38.75dBm)	219.8125	
TRS15.9	<u>High Voltage</u> 15.5V	$\pi/4$ DQPSK (1/2 Rate)	25W PEP (44.0dBm)	217.6125	5% RMS
TRS15.10				219.8125	
TRS15.11				221.9875	
TRS15.12			7.5W PEP (38.75dBm)	219.8125	

Table 12 – Transmit Modulation Error Test TRS15

### 4.13 Transmit Sideband Spectrum TRS16

Connect the Radio for TX testing per Section 3.1 Execute the commands to the maintenance port to set the radio up for Transmit, this will include the modulation type, frequency, and output power indicated in the table. The VSA shall be setup to measure the Sideband Spectrum according to the Mask defined below. Pass/Fail is reported by the VSA. This measurement shall be done at 219.8125MHz, 25W PEP, 13.6VDC, Half-rate  $\pi/4$  DQPSK. The measurement is set for Max Hold using Peak Detector, a minimum of four sweeps shall be taken.

Frequency	Rejection
kHz	dBc
-100	72
-13.75	72
-13.75	65
-12.25	35
-12	30
-12	0
0	0
12	0
12	30
12.25	35
13.75	65
13.75	72
100	72

Table 13 – Transmit Sideband Spectrum Mask TRS16

#### 4.14 Adjacent Channel Power Ratio TRS17

Connect the Radio for TX testing per Section 3.1 Execute the commands to the maintenance port to set the radio up for Transmit, this will include the modulation type, frequency, and output power indicated in the table. The VSA shall be setup to measure the adjacent channel power. The value shall be compared to the limits. The measurement is taken at mid-level voltage (13.6VDC).

Test #	Modulation	Power (PEP)	Frequency(MHz)	Min (dB)
TRS17.1	$\pi/4$ DQPSK (1/2 Rate)	25W	219.8125	70

Table 14 – Adjacent Channel Power Ratio TRS17

#### 4.15 LAN and Maintenance Ethernet Port Test TRS18

Ping the LAN and Maintenance Ethernet ports and verify a correct response with no packets lost.

#### 4.16 SD Card TRS19

The SD Card interface is verified during the course of Testing and Flashing the unit. Initial boot-up of the unit is done through the application resident on the SD Card. Once the unit boots and displays the SW revisions the SD Card read operations are considered validated.

A second validation of reading from the SD Card occurs when the application is written from the SD card into the radio's FLASH.

A third verification of the SD Card occurs during the POST. The POST validates SDCARD Preset, SDCARD Fail Pin and SDCARD Access.

#### 4.17 GPS TRS20

The Wayside Radio GPS connectivity and DC bias are validated through an RF check and a DC Bias measurement. Connect a bias tee to the Wayside Radio GPS Port. The bias Tee shall provide a DC Block to the RF Path and a 50mA DC load from the Wayside Radio GPS Port. The Bias Tee shall not adversely affect the RF performance of the Wayside Radio GPS.

The RF Path of the Bias Tee shall be connected to a GPS Simulator capable of simulating at least 4 GPS satellite signals. Enable the GPS Simulator at a level of -130 dBm and send the CLI commands to the radio that enable GPS Messaging. The GPS Messages are parsed for the C/No ratio of the satellites and GPS Fix. The test shall be considered a pass if the GPS has a fix at -130 dBm.

The GPS DC Loading is also verified during DUT test. A Bias tee is used to provide a 50 mA load on the GPS DC output. The voltage across this load shall be 2.5V +/- 10%.

## 4.18 Temperature Sampling

A 10% sampling of PP1 radios will be tested at the temperature extremes of -40C and 70C. The tests outlined in section 5 of this document will be executed at the temperature extremes with the parametric deviations listed in the table below. Hipot, and ground continuity are not part of the Temperature testing.

The radios will be put into a temperature chamber and remain unpowered while the oven is ramped to either extreme. The units shall be soaked a minimum of two hours at the dwell temperature. The radios will be put into a temperature chamber and remain unpowered while the oven is ramped to either extreme. The units shall be soaked a minimum of two hours at the dwell temperature. Continue to soak the units until the first powered up radio's Master Board device temperature is within +/-3 degrees of the target temperature. Table 15 provides the de-rating allowed at the temperature extremes.

Note that the specification for Tx ACPR and Tx Sideband Spectrum are not defined at the temperature extremes. Data will be collected on ACPR and any Tx Sideband Spectrum Failures.

Specification	Nom Limit	DFS	OverTemp Limit
Rx Sensitivity (Half Rate)	-111dBm	6dB	-105dBm
Rx Sensitivity (Full Rate)	-108dBm	6dB	-102dBm
Rx Error Behavior At High	-7dBm	ND	ND
Tx Output Pwr (TRS16)	25WPEP (44.0 dBm)	+2/-3 dB	41.0 – 46.0 dBm
	7.5WPEP (38.75 dBm)		30 – 40.75 dBm
Tx Frequency Accuracy (TRS17)	+/-0.25ppm <sup>1</sup>	ND	+/-1.5ppm
Tx EVM (TRS12)	3%	ND	ND
Tx Sideband Spectrum (TRS19)	Table	ND	ND
Tx ACR (TRS20)	70 dB	ND	ND

Table 15 – DFS for Temperature Testing

1 – Note that the +/-0.25ppm Accuracy is for tuning and the specification for accuracy for the radio is +/-1.5ppm

#### 4.19 ESS

TBD

#### 4.20 Ground Continuity TRS21

A fully assembled Wayside Radio shall be tested for ground continuity by measuring the resistance between several contact points on the radio. The table below outlines the contact points and maximum allowable resistance.

Test#	Chassis Contact Points	Limit
TRS21.1	Ground Stud to ANT outer barrel.	< 1.0 $\Omega$
