# 1. PARKLANDS AND WILD AND SCENIC RIVERS

## 1.1 INTRODUCTION

This methodology explains how the NEC FUTURE program will evaluate the potential effects of the Tier 1 EIS Alternatives on parklands and wild and scenic rivers in the Tier 1 EIS.

Federal agencies are required to assess the effects of their actions on parklands and wild and scenic rivers. Parklands are protected under Section 4(f) of the United States Department of Transportation (USDOT) Act. Parklands having received funding from the Land and Water Conservation Fund Act (LWCF) are afforded additional protection under Section 6(f) of the LWCF. Wild and Scenic Rivers are protected by the Wild and Scenic Rivers Act.

This methodology focuses on the identification of and potential effects on these resources; it is not considered the Section 4(f) and Section 6(f) evaluations. Parklands identified as being affected will be further evaluated in the Section 4(f) and Section 6(f) Tier 1 EIS chapter to determine if the potential for a “use” under Section 4(f) or a “conversion” under Section 6(f) of these resources might occur.

This methodology presents the regulatory framework, involved government agencies, expected regulatory and other outcomes of the Tier 1 EIS process and relevance to Tier 2, project-level assessments. It also identifies data sources, metrics and methods to be used to document existing conditions and analyze environmental consequences. This methodology may be revised as the NEC FUTURE program advances and new information is available.

## 1.2 DEFINITIONS

Parklands include parks and outdoor recreational facilities, bird sanctuaries, wildlife preserves, resource management areas, federal or state forests, and similar resources that are publicly-owned or have public access.

Wild and scenic rivers are those rivers listed on the National Rivers Inventory and defined as “selected rivers of the Nation which, with their immediate environments, possess outstanding remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural or other similar values unique natural.”

## 1.3 RELATED RESOURCES

In order to assess the effects on parklands and wild and scenic rivers, the effects assessment from other resources evaluated as part of the Tier 1 EIS will be considered. The related resources to be used in this evaluation are included in Table 1.

Table 1 – Related Resource Inputs to Parklands and Wild and Scenic Rivers

Resource	Input to Parklands and Wild and Scenic Rivers
Noise & Vibration	<ul style="list-style-type: none"> <li>Location of areas where noise and vibration thresholds are exceeded by the Tier 1 EIS Alternatives within the Affected Environment</li> </ul>
Visual & Aesthetic	<ul style="list-style-type: none"> <li>Location of areas where important/particularly sensitive viewsheds or aesthetic characteristics are identified and potentially affected by the Tier 1 EIS Alternatives within the Affected Environment</li> </ul>
Land Cover	<ul style="list-style-type: none"> <li>Areas where a “conversion” of land cover may occur</li> </ul>
Ecological Resources	<ul style="list-style-type: none"> <li>Location of ecological resources potentially affected by the Tier 1 EIS Alternatives within the Affected Environment</li> </ul>

## 1.4 AGENCY AND REGULATORY FRAMEWORK

Parklands and wild and scenic rivers are subject to regulation by multiple federal agencies and multiple legislative and regulatory vehicles. Federal agencies, applicable legislation and regulations are listed in Table 2. Each of these will be considered, consistent with a Tier 1 level of assessment, in the evaluation of parklands and wild and scenic rivers for the NEC FUTURE program.

### 1.4.1 Regulatory Compliance

No formal agency approvals or permits would be requested for the Tier 1 EIS. However, the FRA will engage in dialogue with the NPS and USFWS on the methodology, assumptions and findings of the Tier 1 EIS analyses. The requirements for subsequent Tier 2 evaluations, including compliance with applicable regulations including Section 4(f) of the US Department of Transportation Act, Section 6(f) of the US Land and Water Conservation Fund (LWCF) Act, the Forest Service Organic Administration Act, and the National Forest Management Act will be described in the Tier 1 EIS. During the Tier 1 EIS process, the FRA will identify potential opportunities to streamline subsequent Tier 2 environmental reviews (see Section 1.7). Coordination with the NPS and USFWS will be consistent with the NEC FUTURE’s Agency Coordination Plan and support the Statement of Principles (SOP) established between the FRA and federal regulatory agencies as part of the Council on Environmental Quality (CEQ) Pilot program.

## 1.5 METHODOLOGY TO ASSESS EFFECTS

This effects assessment methodology identifies the approach and assumptions for describing existing conditions of parklands and wild and scenic rivers and environmental consequences of the Tier 1 EIS Alternatives on those resources. It identifies data sources, defines the Affected Environment and Context Area considered for parklands and wild and scenic rivers, and describes the approach for assessing potential direct effects.<sup>1</sup> Direct effects include encroachment or alteration of existing parklands and wild and scenic rivers. Indirect effects,<sup>2</sup> such as those resulting from induced growth as a result of the Tier 1 EIS Alternatives, will be addressed in a separate methodology (see Indirect Effects Assessment Methodology).

<sup>1</sup> Direct effects are caused by the action and occur at the same time and place (40 CFR § 1508.8)

<sup>2</sup> Indirect effects are those that occur later in time or are further removed in distance (40 CFR § 1508.8)

Table 2 – Management and Regulation of Parklands and Wild and Scenic Rivers

Source: NEC FUTURE JV Team, 2013

1. Administers and approves use of a Section 4(f) resource when there are no feasible and prudent avoidance alternatives and the project incorporates measures to minimize harm; makes determinations of *de minimis* impact findings.
2. Section 774.17 of 23 C.F.R. provides for the definition of the term “feasible and prudent avoidance alternative” as “one that avoids using Section 4(f) property and does not cause other severe problems of a magnitude that substantially outweighs the importance of protecting the Section 4(f) property.”
3. If there is no feasible and prudent alternative is found, then the U.S. DOT may only approve a project that “includes all possible planning, as defined in Section 774.17 to minimize harm to the property resulting in such use.”
4. Under Section 4(f), *de minimis* impacts are defined as those impacts that do not adversely affect the activities, features, or attributes of the Section 4(f) property. For parks, *de minimis* impacts are defined as those that do not adversely affect the activities, features, and attributes of the resource. The official with jurisdiction over the park or property must concur that the project will not adversely affect the resource. For historic properties, a *de minimis* impact finding may be made if a “no historic properties affected” or “no adverse effect” determination is made through the Section 106 process and concurred upon by the State Historic Preservation Officer (SHPO).

### 1.5.1 Existing Conditions

The data sources listed in Table 3 will be used to establish the existing conditions for parklands and wild and scenic rivers.

The existing conditions for parklands and wild and scenic rivers will be documented in the Tier 1 EIS for an established Affected Environment and Context Area. The Affected Environment is a 2,000-foot swath centered on the Representative Route<sup>3</sup> for the Tier 1 EIS Alternatives. This 2,000-foot swath is sufficiently wide to:

- ▶ Encompass and account for the improvements associated with a Representative Route including infrastructure improvements (such as embankments, aerial structures, track improvements), ancillary facilities (such as stations, yards and parking structures), or service changes
- ▶ Account for contiguous parklands and wild and scenic rivers that may extend beyond the Representative Route
- ▶ Consider areas outside of the Representative Route for proximity effects<sup>4</sup> related to noise and vibration and visual and aesthetic changes. While noise and vibration and visual and aesthetic changes could extend beyond the 2,000 feet, this methodology assumes that the most prominent effects would be noticed closest to the rail improvement.

For parklands located within the Affected Environment for each Tier 1 EIS Alternative, the name, location, and ownership of will be provided, and the total area (acres) within the Affected Environments will be estimated within each state on a county-by-county basis. Acres of parklands will be presented in tables and also mapped using GIS. Parklands that have received funding from the LWCF Act will be identified. The intended purpose of the parkland (active or passive recreation) will be noted if information is available. The acres of wild and scenic rivers located within the Affected Environment will be presented in tables and mapped using GIS.

The Context Area is 5 miles wide, centered on the Representative Route for each of the Tier 1 EIS Alternatives. Within the Context Area parklands and wild and scenic rivers will be mapped but acreage will not be quantified, order to qualitatively characterize the resources that could be affected should the Representative Route shift. For resources within the Context Area, general characteristics of, and relative size and location of, parklands and wild and scenic rivers will be presented; this information will be used to supplement the quantitative assessment for the Affected Environment.

---

<sup>3</sup> Representative Route refers to a proposed route or potential alignment for a Tier 1 EIS Alternative. The Representative Route includes the physical footprint of the improvements associated with the Tier 1 EIS Alternatives. The horizontal and vertical dimensions of the footprint of the Representative Route are based on prototypical cross-sections for these improvements. The Representative Route is used as a proxy for estimating the potential effects of a route whose location could shift during subsequent project-level reviews.

<sup>4</sup> Proximity Effects are defined as those direct effects that do not physically encroach on the resource but are severe enough that they could influence or have an adverse effect on the quality or intended use of the resource.

Table 3 – Data Sources for the Evaluation of Parklands and Wild and Scenic Rivers

### 1.5.2 Environmental Consequences

Within the Affected Environment, environmental consequences will be determined for those areas where a Representative Route of a Tier 1 EIS Alternative overlaps with parklands and wild and scenic rivers. A qualitative assessment of resources present within the Context Area will be used to supplement the effects assessment.

The following provides the steps that will be undertaken to evaluate the environmental consequences of each Tier 1 EIS Alternative on parklands and wild and scenic rivers within the Affected Environment:

#### Parklands

The following will be considered as an effect on parklands:

- ▶ If a portion or all of the total acreage of parkland identified within the Affected Environment is within the Representative Route of the Tier 1 EIS Alternatives.
- ▶ If a portion or all of the total acreage of parkland identified within Affected Environment is considered to be affected by noise and vibration threshold exceedances or changes in the visual or aesthetic quality from rail infrastructure/ancillary facilities; or if a land cover conversion is identified within parkland.

The effects assessment will be undertaken using GIS mapping and calculations. Due to limited information and detail consistent for a Tier 1 assessment, no determination on the severity of the effects described below will be made as part of the Tier 1 EIS.

- ▶ Parkland acreage identified within the Affected Environment will be overlaid with the Representative Routes for the Tier 1 EIS Alternatives.
- ▶ The area (acres) of parkland within Representative Routes will be calculated and the potential for a Representative Route to bisect a parkland will be described.
- ▶ Areas mapped as having an exceedance of a noise and vibration threshold will be overlaid with parklands within the Affected Environment. Where a noise and vibration threshold exceedance and parkland overlap, a potential proximity effect from noise and vibration on that parkland will be noted.
- ▶ Visually sensitive areas and areas having unique aesthetic qualities will be overlaid with parklands in the Affected Environment. Where changes to the existing visual and aesthetic character would result from the proposed rail infrastructure (such as embankments, aerial structures, track improvements) or ancillary facilities (such as stations, yards and parking structures) overlap with parklands, a potential proximity effect from changes to the visual and aesthetic character will be noted.
- ▶ Areas mapped and identified as a potential conversion in land cover will be overlaid with parklands identified within the Affected Environment. Where a potential conversion of land cover and a parkland overlap, a potential effect will be noted. The total acreage of the potential conversion will be compared to the total acreage of the parkland.

## Wild and Scenic Rivers

The following will be considered as an effect on a wild and scenic river:

- ▶ The Representative Route associated with the Tier 1 EIS Alternatives crosses or runs parallel with a river designated as a wild and scenic river.

Using GIS, the identified wild and scenic rivers will be overlaid with the Representative Routes of the Tier 1 EIS Alternatives. Where a Representative Route crosses or runs parallel to the resource, a potential effect will be noted. Effects from a proposed crossing or parallel route could include visual impacts from the proposed rail infrastructure (such as embankments, aerial structures, and track improvements) or ancillary facilities (such as stations, yards and parking structures) that could detract from the characteristics that make the river unique. Whether or not the crossing or parallel rail line would be introduced or if it is an expansion of an existing crossing or parallel rail line/transportation corridor will be noted.

For the Context Area, the potential for parklands and wild and scenic rivers to be impacted should there be a shift in a Representative Route will be discussed.

Temporary construction-related effects to parklands and wild and scenic rivers will be described as to the location, duration and type of activity. The NEC FUTURE program overall approach to

assessing construction-related effects at the Tier 1 EIS level is further described in a separate Construction Effects Assessment Approach document. Construction methods and activities for the Tier 1 EIS Alternatives will be the basis of this assessment and will be described in Chapter 2.

### 1.5.3 Mitigation Strategies

A menu of potential mitigation measures will be developed on a programmatic scale for further consideration in Tier 2. An example of a programmatic mitigation measure would be to incorporate the use of context sensitive design in future stages of project development or incorporate natural design features such as earthen berms and tree plantings.

## 1.6 TIER 1 EIS OUTCOMES

This Tier 1 EIS parklands and wild and scenic rivers assessment will:

- ▶ Quantify acres of parklands and wild and scenic rivers within the Affected Environment
- ▶ Map the distribution of parklands and wild and scenic rivers in the Affected Environment and Context Area
- ▶ Calculate acreages of parkland impacts within a Representative Route
- ▶ Overlay information from noise, vibration and visual and aesthetics to identify potential “proximity effects” on parklands
- ▶ Identify where the Representative Route associated with the Tier 1 EIS Alternative crosses or runs parallel to designated wild and scenic river
- ▶ Identify potential mitigation strategies
- ▶ Describe regulatory compliance requirements for subsequent Tier 2 evaluations

## 1.7 APPLICABILITY TO TIER 2 ASSESSMENTS

The Tier 1 analysis will identify areas where there is potential for effects to parklands and wild and scenic rivers. Tier 2 analyses would further define the effects to parklands and wild and scenic rivers, as well as include the development of mitigation measures and designs that would avoid or minimize effects on parklands and wild and scenic rivers.

Additionally, FRA will identify ways in which agency coordination during the Tier 1 process could create efficiencies and help streamline subsequent Tier 2 reviews and approvals. For example, if a particular portion or element of a Tier 1 EIS Alternative avoids the physical encroachment or any other impact on parklands and wild and scenic rivers, FRA may coordinate with NPS, and USFWS to determine whether or not those portions need further evaluation during the Tier 2 environmental review process.

# Application of Effects-Assessment Methodology

---

## 4.1 PARKLANDS AND WILD AND SCENIC RIVERS: APPLICATION OF EFFECTS-ASSESSMENT METHODOLOGY

### 4.1.1 Variations to Effects-Assessment Methodology

There were two variations to the Effects-Assessment Methodology during the Tier 1 Draft EIS analysis:

- ▶ The definition of parklands was updated to this: “For the purposes of this analysis, parklands include parks and outdoor recreational facilities, bird sanctuaries, wildlife preserves, resource management areas, federal and state forests, and similar resources that are publicly owned.”
- ▶ Potential vibration impacts were only discussed in general terms. Vibration impacts are more applicable to structures, so a detailed vibration impact analysis was not conducted.

### 4.1.2 Data Variations

There was one update from the identified data sources in the Effects-Assessment Methodology during the development of the Tier 1 Draft EIS analysis:

- ▶ Data on the intended purpose of parklands was not readily or consistently available, so it was not collected.

### 4.1.3 Criteria for Analysis

#### Existing Conditions

- ▶ The acreages for the total area for each park were totaled by county and state.
- ▶ Acreages within the Affected Environment for each Action Alternative were totaled by county and state.
- ▶ The percentage of the total park area was calculated for each resource and by county and state.
- ▶ The parks with 50 percent or more acreage in the Affected Environment were identified in the main body of the Tier 1 Draft EIS since those parks would have the most potential to be affected by the Action Alternatives.

#### Environmental Consequences

- ▶ Those parks that would be crossed by the Representative Route were identified since they would have a higher likelihood of impacts by the Action Alternatives.
- ▶ Those parks that would be intersected by a proposed tunnel were identified. The parks that would be intersected by a tunnel have the potential to be affected by construction activities.
- ▶ Those Wild and Scenic Rivers that would be crossed by the Representative Route were identified since they would have a higher likelihood of impacts by the Action Alternatives.

#### Environmental Consequences – Stations

- ▶ Those parks that exist within proposed station areas were identified since they would have a higher likelihood of impacts by the Action Alternatives.
